3DSTATE_AMFS_POINTERS_REMOVED

3DSTATE_AMFS_POINTERS_REMOVED		
Source:	BSpec	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Reserved** Format: MBZ

3DSTATE_CONSTANT_ALL_DATA

3DSTATE_CONSTANT_ALL_DATA		
Source:	RenderCS	
Size (in bits):	64	
Default Value:	0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0..1	63:5	**Pointer To Constant Buffer** Format: GraphicsAddress63-5 The value of this field is the virtual address of the location of the push constant buffer. **Programming Notes** Constant buffers must be allocated in linear (not tiled) graphics memory.
	4:0	**Constant Buffer Read Length** Format: U5 This field specifies the length of the constant data to be loaded from memory in 256-bit units. **Programming Notes** • The sum of the read length fields for all pointers must be less than or equal to the size of 64 • Zero means there no data to fetch for this buffer pointer.

3DSTATE_CONSTANT(Body)

3DSTATE_CONSTANT(Body)		
Source:	RenderCS	
Size (in bits):	320	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0	31:16	**Constant Buffer 1 Read Length** Format: U16 read length This field specifies the length of the constant data to be loaded from memory in 256-bit units. **Programming Notes** • The sum of all four read length fields must be less than or equal to the size of 64 • Setting the value of the register to zero will disable buffer 1. • If disabled, the **Pointer to Constant Buffer 1** must be programmed to zero. if gather constant are enabled, this field must be non-zero if a there was a preceding corresponding 3DSTATE_GATHER_CONSTANT_*., otherwise this field must be zero.
	15:0	**Constant Buffer 0 Read Length** Format: U16 read length This field specifies the length of the constant data to be loaded from memory in 256-bit units. **Programming Notes** • The sum of all four read length fields must be less than or equal to the size of 64 • Setting the value of the register to zero will disable buffer 0. • If disabled, the **Pointer to Constant Buffer 0** must be programmed to zero.
1	31:16	**Constant Buffer 3 Read Length** Format: U16 read length This field specifies the length of the constant data to be loaded from memory in 256-bit units. **Programming Notes** • The sum of all four read length fields must be less than or equal to the size of 64 • Setting the value of the register to zero will disable buffer 3. • If disabled, the **Pointer to Constant Buffer 3** must be programmed to zero.
	15:0	**Constant Buffer 2 Read Length** Format: U16 read length This field specifies the length of the constant data to be loaded from memory in 256-bit units. **Programming Notes**

3DSTATE_CONSTANT(Body)

		• The sum of all four read length fields must be less than or equal to the size of 64 • Setting the value of the register to zero will disable buffer 2. • If disabled, the **Pointer to Constant Buffer 2** must be programmed to zero.
2..3	63:5	**Pointer To Constant Buffer 0** Format: GraphicsAddress63-5 **Description** When CONSTANT_BUFFER Address Offset Disable in CS_DEBUG_MODE2 register is set, the value of this field is the virtual address of the location of the push constant buffer. GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47]. When CONSTANT_BUFFER Address Offset Disable in CS_DEBUG_MODE2 register is cleared, the value of this field is the offset into the Dynamic State Base Address. Only [47:5] of the field are added to the base address to generate the virtual address to be fetched from memory.
	4:0	**Reserved** Format: MBZ
4..5	63:5	**Pointer To Constant Buffer 1** Format: GraphicsAddress63-5 This field points to the location of Constant Buffer 1. If gather constants are enabled This field is an offset of constant Buffer1 from the Gather Pool BASE ADDRESS. If gather constants is disabled, the value of this field is the virtual address of the location of the push constant buffer. GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47]. **Programming Notes** Constant buffers must be allocated in linear (not tiled) graphics memory.
	4:0	**Reserved** Format: MBZ
6..7	63:5	**Pointer To Constant Buffer 2** Format: GraphicsAddress63-5 The value of this field is the virtual address of the location of the push constant buffer 2. GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47]. **Programming Notes** Constant buffers must be allocated in linear (not tiled) graphics memory.

3DSTATE_CONSTANT(Body)		
	4:0	**Reserved** Format: MBZ
8..9	63:5	**Pointer To Constant Buffer 3** Format: GraphicsAddress63-5 The value of this field is the virtual address of the location of the push constant buffer 3. GraphicsAddress [63:48] are ignored by the HW and assumed to be in correct canonical form [63:48] == [47]. **Programming Notes** Constant buffers must be allocated in linear (not tiled) graphics memory.
	4:0	**Reserved** Format: MBZ

A32 Buffer Base Address Message Header Control

MHC_A32_BBA - A32 Buffer Base Address Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:10	**Buffer Base Address Offset** Format: GeneralStateOffset[31:10] Specifies the base address offset page [31:10] for A32 stateless messages. **Restriction** Restriction : When using stateless A32 Data Port messages, General State Base Address[47:12] + Buffer Base Address[31:10] must be less than 2^48. It is illegal for this to be greater or equal than 2^48.
	9:0	**Reserved** Format: MBZ Ignored.

A32 Scaled Header Present Message Descriptor Control Field

MDC_A32_MHP - A32 Scaled Header Present Message Descriptor Control Field

Source:	BSpec
Size (in bits):	1
Default Value:	0x00000000

DWord	Bit	Description
0	0	**Message Header Present** Format: Enumeration Specifies if the message uses the optional message header to modify the access type and address calculation, in combination with the MDC_A32_SSO field.

Value	Name	Description
0h	No	Message header is not present. The Sideband Scale Offset field from the Message Descriptor are used as offsets with the Address Payload.
1h	Yes	Message header is present. It specifies a Base Address Offset and a Scale pitch to use with each of the offsets from the Address Payload.

Programming Notes
The access is an SLM access if the Sideband Scale Offset is enabled when the Message Header is not present; otherwise the access is a A32 access.

A32 Sideband Scale and Offset Enable Message Descriptor Control Field

MDC_A32_SBSO - A32 Sideband Scale and Offset Enable Message Descriptor Control Field

Source: BSpec
Size (in bits): 8
Default Value: 0x00000000

DWord	Bit	Description
0	7	**Sideband Offset Enable** Format: Enable When set, enables adding the 16-bit offset from the Sideband to all the offsets in the Address Payload for the A32 or SLM access. The 16-bit Sideband Offset is specified in the extended function control field in the SEND instruction. **Programming Notes** If set and a Message Header is not present, then the access is an SLM access and the Sideband Offset and Scale are used as offsets with the Address Payload. Otherwise, the access is an A32 access, and either or both of the Message Header and Sideband Offsets are added to the offsets in the Address Payload.
	6:0	**Scale** Format: U7 Specifies the scale pitch to be used for SLM messages as (#bytes-1). **Programming Notes** If this is a A32 message, this field is ignored and the scale pitch is supplied by the Message Header. If this is an A32 message and no Message Header present, then the scale is 0 (i.e. pitch = 1 byte).

A64 Data Size Message Descriptor Control Field

MDC_A64_DS - A64 Data Size Message Descriptor Control Field

Source: BSpec
Size (in bits): 2
Default Value: 0x00000000

DWord	Bit	Description
0	1:0	**Data Size** Format: Enumeration Specifies the number of data elements to be read or written

Value	Name	Description	Programming Notes
00h	DE1	1 data element (B, DW, QW)	
01h	DE2	2 data elements (B, DW, QW)	
02h	DE4	4 data elements (B, DW, QW)	
03h	DE8	8 data elements (B, DW, QW)	Restriction : This setting is supported for DW and QW but not for B. For bytes, the maximum number of data elements is 4.

Restriction
Restriction : The number of elements is constrained by SIMD Mode and Data Width. The max data payload limit is 256B: 2 elements SIMD16 QW, 4 elements SIMD16 DW, or 4 elements SIMD8 QW.

A64 Dual Oword Block Message Header

MH_A64_OWDB - A64 Dual Oword Block Message Header

Source: DataPort 1

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:0	**BlockOffset0** Format: U64 Specifies the U64 byte offset of Oword Block 0. **Programming Notes** If the BlockOffset is not in the 48-bit canonical address range, the access is Out-of-Bounds. **Restriction** Restriction : The byte offset must be aligned to the message's data type. Dwords have [1:0] = 0, Qwords have [2:0] = 0, and Hwords have [4:0] = 0.
2..3	63:0	**BlockOffset1** Format: U64 Specifies the U64 byte offset of Oword Block 1. **Programming Notes** If the BlockOffset is not in the 48-bit canonical address range, the access is Out-of-Bounds. **Restriction** Restriction : The byte offset must be aligned to the message's data type. Dwords have [1:0] = 0, Qwords have [2:0] = 0, and Hwords have [4:0] = 0.
4..7	127:0	**Reserved** Format: Ignore Ignored

A64 Hword Block Message Header

MH_A64_HWB - A64 Hword Block Message Header

Source: DataPort 1

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:0	**BlockOffset** Format: U64 Specifies the U64 byte offset of Oword block. **Programming Notes** If the BlockOffset is not in the 48-bit canonical address range, the access is Out-of-Bounds. **Restriction** Restriction : The byte offset must be aligned to the message's data type. Dwords have [1:0] = 0, Qwords have [2:0] = 0, and Hwords have [4:0] = 0.
2..4	95:0	**Reserved** Format: Ignore Ignored
5	31:0	**Hword Channel Mode** Format: MHC_A64_CMODE Specifies the Hword Channel Mode
6..7	63:0	**Reserved** Format: Ignore Ignored

A64 Hword Data Blocks Message Descriptor Control Field

MDC_A64_DB_HW - A64 Hword Data Blocks Message Descriptor Control Field

Source: BSpec
Size (in bits): 3
Default Value: 0x00000001

DWord	Bit	Description
0	2:0	**Data Blocks** Format: Enumeration Specifies the number of Hwords to be read or written

Value	Name	Description
01h	HW1 **[Default]**	1 Hword block
02h	HW2	2 Hword blocks
03h	HW4	4 Hword blocks
04h	HW8	8 Hword blocks
Others	Reserved	Ignored

A64 Oword Block Message Header

MH_A64_OWB - A64 Oword Block Message Header

Source: DataPort 1

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:0	**BlockOffset** Format: U64 Specifies the U64 byte offset of Oword block. **Programming Notes** If the BlockOffset is not in the 48-bit canonical address range, the access is Out-of-Bounds. **Restriction** Restriction : The byte offset must be aligned to the message's data type. Dwords have [1:0] = 0, Qwords have [2:0] = 0, and Hwords have [4:0] = 0.
2..7	191:0	**Reserved** Format: Ignore Ignored

A64 Oword Data Blocks Message Descriptor Control Field

MDC_A64_DB_OW - A64 Oword Data Blocks Message Descriptor Control Field

Source: BSpec
Size (in bits): 3
Default Value: 0x00000000

DWord	Bit	Description
0	2:0	**Data Blocks** Format: Enumeration Specifies the number of Oword blocks to be read or written

Value	Name	Description
00h	OW1L	1 Oword, read into or written from the low 128 bits of the destination register
01h	OW1U	1 Oword, read into or written from the high 128 bits of the destination register
02h	OW2	2 Owords
03h	OW4	4 Owords
04h	OW8	8 Owords
Others	Reserved	Ignored

A64 Oword Dual Data Blocks Message Descriptor Control Field

MDC_A64_DB_OWD - A64 Oword Dual Data Blocks Message Descriptor Control Field

Source: BSpec
Size (in bits): 3
Default Value: 0x00000001

DWord	Bit	Description
0	2:0	**Data Blocks** Format: Enumeration Specifies the number of Oword blocks to be read or written

Value	Name	Description
01h	OWD1 **[Default]**	1 Hword register, 2 Owords
03h	OWD4	4 Hword registers, 8 Owords
Others	Reserved	Ignored

A64 Scaled Data Port 2 Message Header

MH2_A64 - A64 Scaled Data Port 2 Message Header

Source: DataPort 2

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**Surface Pitch** Format: MHC_PITCH Specifies the 16-bit surface pitch to use with scaled A64 stateless messages.
1..3	95:0	**Reserved** Format: Ignore Ignored
4..5	63:0	**Buffer Base Address** Format: GraphicsAddress[63:0] Specifies the surface base address[63:0] for scaled A64 stateless messages. The address must be Dword aligned (bits [1:0] = 0). **Programming Notes** If the Buffer Base Address is not in 48-bit canonical form, the access is Out-of-Bounds. Stateless A64 bounds checking rules specify that any address calculation that crosses the canonical address boundary is treated as out-of-bounds. A64 address calculations always use positive offsets, and do not support programming language constructs with negative offsets or indices (e.g. array[-1]).
6..7	63:0	**Reserved** Format: Ignore Ignored

A64 Scaled Header Present Message Descriptor Control Field

MDC_A64_MHP - A64 Scaled Header Present Message Descriptor Control Field

Source: BSpec
Size (in bits): 1
Default Value: 0x00000000

DWord	Bit	Description
0	0	**Message Header Present** Format: Enumeration Specifies if the message uses the optional message header to modify the A64 address calculation, in combination with MDC_A64_SSO field. **Value / Name / Description** 0h / No / Message header is not present 1h / Yes / Message header is present **Programming Notes** The access is Out-of-Bounds if the SideBand Offset is enabled when the Message Header is not present.

A64 Sideband Scale and Offset Enable Message Descriptor Control Field

MDC_A64_SBSO - A64 Sideband Scale and Offset Enable Message Descriptor Control Field

Source: BSpec
Size (in bits): 8
Default Value: 0x00000000

DWord	Bit	Description
0	7	**Sideband Offset Enable** Format: Enable If set, the Sideband Offset is added to the Message Header's Base Address Offset. The 16-bit Sideband Offset is specified in the extended function control field in the SEND instruction. **Programming Notes** It is an illegal A64 encoding to enable the SideBand Offset when the Message Header is not present. That encoding combination is an SLM access in A32 message, but in an A64 message the illegal access is handled as Out-of-Bounds.
	6:0	**Reserved** Format: MBZ Ignored

AddrSubRegNum

AddrSubRegNum		
Source:	EuIsa	
Size (in bits):	4	
Default Value:	0x00000000	

Address Subregister Number
This field provides the subregister number for the address register. The address register contains 8 sub-registers. The size of each subregister is one word. The address register contains the register address of the operand, when the operand is in register-indirect addressing mode.
This field applies to the destination operand and the source operands. It is ignored (or not present in the instruction word) for an immediate source operand.
This field is present if the operand is in register-indirect addressing mode; it is not present if the operand is directly addressed.
An address subregister used for indirect addressing is often called an index register.

DWord	Bit	Description
0	3:0	**Address Subregister Number**

Value	Name
0-15	Address Subregister Number

AMFS_STATE_REMOVED

AMFS_STATE_REMOVED		
Source:	RenderCS	
Size (in bits):	32	
Default Value:	0x00000000	

DWord	Bit	Description
0	31:0	**Reserved** Format: MBZ

Any Binding Table Index Message Descriptor Control Field

MDC_BTS_SLM_A32 - Any Binding Table Index Message Descriptor Control Field

Source: BSpec
Size (in bits): 8
Default Value: 0x00000000

DWord	Bit	Description
0	7:0	**Binding Table Index** Format: Enumeration Specifies the surface for the message, which can be Surface State Model, SLM or Stateless.

Value	Name	Description
00h-0EFh	BTS	Index of Binding Table State Surfaces
F0h-0FBh	Reserved	Reserved for future use
0FCh	SSO	Specifies a Surface State Offset supplied by the extended message descriptor
0FEh	SLM	Specifies an SLM access
0FFh	A32_A64	Specifies a A32 or A64 Stateless access that is locally coherent (coherent within a thread group)
0FDh	A32_A64_NC	Specifies a A32 or A64 Stateless access that is non-coherent (coherent within a thread).

Restriction
Restriction : When using A32_A64_NC, SW must ensure that 2 threads do not both access the same cache line (64B)

Atomic Float Binary Operation Message Descriptor Control Field

MDC_FOP2 - Atomic Float Binary Operation Message Descriptor Control Field

Source: BSpec
Size (in bits): 2
Default Value: 0x00000001

DWord	Bit	Description
0	1:0	**Atomic Float Operation Type** Format: Enumeration Specifies the atomic float binary operation to be performed

Value	Name	Description	Programming Notes
01h	AOP_FMAX **[Default]**	new_dst = fmax(old_dst, src0)	The fmax operation implements the IEEE specification, which differs slightly from the DX specifications when a source operand is a sNaN. fmax(x,qNaN) = fmax(qNaN,x) = x fmax(x,sNaN) = fmax(sNaN,x) = quietize(sNaN) fmax(sNaN,sNaN) = fmax(sNaN,qNaN) = fmax(qNan,sNaN) = quietize(sNaN) fmax(qNaN,qNan) = qNaN Fmax with sNaN operand returns sNaN instead of quietize(sNaN) Fmax(-0,+0) = -0. Should be +0, to match EU Fmax instruction.
02h	AOP_FMIN	new_dst = fmin(old_dst, src0)	The fmin operation implements the IEEE specification, which differs slightly from the DX specifications when a source operand is a sNaN. fmin(x,qNaN) = fmin(qNaN,x) = x fmin(x,sNaN) = fmin(sNaN,x) = quietize(sNaN) fmin(sNaN,sNaN) = fmin(sNaN,qNaN) = fmin(qNan,sNaN) = quietize(sNaN) fmin(qNaN,qNan) = qNaN Fmin with sNaN operand returns sNaN instead of quietize(sNaN) Fmin(+0,-0) = +0. Should be -0, to match EU Fmin instruction.
Others	Reserved	Ignored	

Programming Notes
When Return Data Control is set, old_dst is returned.

Atomic Float Trinary Operation Message Descriptor Control Field

MDC_FOP3 - Atomic Float Trinary Operation Message Descriptor Control Field

Source: BSpec
Size (in bits): 2
Default Value: 0x00000003

DWord	Bit	Description
0	1:0	**Atomic Float Operation Type** Format: Enumeration Specifies the atomic float trinary operation to be performed

Value	Name	Description	Programming Notes
03h	AOP_FCMPWR **[Default]**	new_dst = (src0 == old_dst) ? src1 : old_dst	The fcmpwr operation performs the comparison using IEEE specification rules, and performs the store as a raw move (so SNaN is not quietized). fcmpwr(NaN,x,y) = NaN fcmpwr(x, NaN,y) = x fcmpwr(x,x, NaN) = NaN
Others	Reserved	Ignored	

Programming Notes
When Return Data Control is set, old_dst is returned.

Atomic Integer Binary Operation Message Descriptor Control Field

MDC_AOP2 - Atomic Integer Binary Operation Message Descriptor Control Field

Source: BSpec
Size (in bits): 4
Default Value: 0x00000001

DWord	Bit	Description
0	3:0	**Atomic Integer Operation Type** Format: Enumeration Specifies the atomic integer binary operation to be performed

Value	Name	Description
01h	AOP_AND **[Default]**	new_dst = old_dst AND src0
02h	AOP_OR	new_dst = old_dst | src0
03h	AOP_XOR	new_dst = old_dst ^ src0
04h	AOP_MOV	new_dst = src0
07h	AOP_ADD	new_dst = old_dst + src0
08h	AOP_SUB	new_dst = old_dst - src0
09h	AOP_REVSUB	new_dst = src0 - old_dst
0Ah	AOP_IMAX	new_dst = imax(old_dst, src0)
0Bh	AOP_IMIN	new_dst = imin(old_dst, src0)
0Ch	AOP_UMAX	new_dst = umax(old_dst, src0)
0Dh	AOP_UMIN	new_dst = umin(old_dst, src0)
Others	Reserved	Ignored

Programming Notes
When Return Data Control is set, old_dst is returned.

Atomic Integer Trinary Operation Message Descriptor Control Field

MDC_AOP3 - Atomic Integer Trinary Operation Message Descriptor Control Field

Source: BSpec
Size (in bits): 4
Default Value: 0x0000000E

DWord	Bit	Description
0	3:0	**Atomic Integer Operation Type** Format: Enumeration Specifies the atomic integer trinary operation to be performed

Value	Name	Description
00h	AOP_CMPWR_2W	new_dst = (src0_2W == old_dst_2W) ? src1_2W : old_dst_2W
0Eh	AOP_CMPWR **[Default]**	new_dst = (src0 == old_dst) ? src1 : old_dst
Others	Reserved	Ignored

Programming Notes
When Return Data Control is set, old_dst is returned.

Atomic Integer Unary Operation Message Descriptor Control Field

MDC_AOP1 - Atomic Integer Unary Operation Message Descriptor Control Field

Source: BSpec
Size (in bits): 4
Default Value: 0x00000005

DWord	Bit	Description
0	3:0	**Atomic Integer Operation Type** Format: Enumeration Specifies the atomic integer unary operation to be performed

Value	Name	Description
05h	AOP_INC **[Default]**	new_dst = old_dst + 1
06h	AOP_DEC	new_dst = old_dst - 1
0Fh	AOP_PREDEC	new_dst = old_dst - 1
Others	Reserved	Ignored

Programming Notes
When Return Data Control is set, new_dst is returned by AOP_PREDEC and otherwise old_dst is returned.

Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:24	**Reserved** Format: MBZ
	23:16	**Binding Table Index** Format: U8 This field specifies the index of binding table entry that will be updated.
	15:0	**Surface State Pointer** Format: SurfaceStateOffset[21:6]RENDER_SURFACE_STATE Surface State Pointer. This address points to a surface state block. This pointer is relative to the Surface State Base Address.

BINDING_TABLE_STATE

BINDING_TABLE_STATE		
Source:	BSpec	
Size (in bits):	32	
Default Value:	0x00000000	
The binding table binds surfaces to logical resource indices used by shaders and other compute engine kernels. It is stored as an array of up to 256 elements, each of which contains one dword as defined here. The start of each element is spaced one dword apart. The first element of the binding table is aligned to a 64-byte boundary. Binding table indexes beyond 256 will automatically be mapped to entry 0 by the HW, w/ the exception of any messages which support the special indexes 240 through 255, inclusive.		
DWord	**Bit**	**Description**
0	31:6	**Surface State Pointer** Format: SurfaceStateOffset[31:6] This 64-byte aligned address points to a surface state block. This pointer is relative to the **Surface State Base Address**
	5:0	**Reserved** Format: MBZ

Bit Definition for Interrupt Control Registers - Blitter

Bit Definition for Interrupt Control Registers - Blitter		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:28	**Reserved** Format: MBZ These bits may be assigned to interrupts on future products/steppings.
	27	**Wait on Semaphore** Exec-List Scheduling: Set when MI_SEMAPHORE_WAIT command is un-successful and when "Inhibit Synchronous Context Switch" is set. Scheduler can use this interrupt to preempt the context waiting on semaphore wait. Ring Buffer Scheduling: Set when MI_SEMAPHORE_WAIT command is un-successful.
	26:25	**Reserved** Format: MBZ
	24	**Context Switch Interrupt** Set when a context switch has just occurred. Exec-List Enable bit needs to be set for this interrupt to occur.
	23	**Reserved** Format: MBZ
	22	**Timeout Counter Expired** Set when the Blitter Command Streamer timeout counter has reached the timeout threshold value. This feature is not POR and SW must never unmask (enable) this interrupt via BCS_IMR.
	21	**Reserved** Format: MBZ
	20	**MI_FLUSH_DW Notify Interrupt** The Pipe Control packet (Fences) specified in 3D pipeline document may optionally generate an Interrupt. The Store QW associated with a fence is completed ahead of the interrupt.
	19	**Blitter Command Parser Master Error** When this status bit is set, it indicates that the hardware has detected an error. It is set by the device upon an error condition and cleared by a CPU write of a one to the appropriate bit contained in the Error ID register followed by a write of a one to this bit in the IIR. Further information on the source of the error comes from the "Error Status Register" which along with the "Error Mask Register" determine which error conditions will cause the error status bit to be set and the interrupt to occur. **Page Table Error:** Indicates a page table error. **Instruction Parser Error:** The Blitter Instruction Parser encounters an error while parsing an instruction.

Bit Definition for Interrupt Control Registers - Blitter		
	18:17	**Reserved** Format: MBZ
	16	**Blitter Command Parser User Interrupt** This status bit is set when an MI_USER_INTERRUPT instruction is executed on the Blitter Command Parser. Note that instruction execution is not halted and proceeds normally. A mechanism such as an MI_STORE_DATA instruction is required to associate a particular meaning to a user interrupt.
	15:0	**Reserved** Format: MBZ

		set and the interrupt to occur. **Page Table Error:** Indicates a page table error. **Instruction Parser Error:** The Blitter Instruction Parser encounters an error while parsing an instruction.
	2:1	**Reserved** Format: MBZ
	0	**Video Enhancement Command Parser User Interrupt** This status bit is set when an MI_USER_INTERRUPT instruction is executed on the Video Enhancement Command Parser. Note that instruction execution is not halted and proceeds normally. A mechanism such as an MI_STORE_DATA instruction is required to associate a particular meaning to a user interrupt.

BLEND_STATE

BLEND_STATE

Source:	BSpec
Size (in bits):	544
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

The blend state is stored as a structure containing a common DWORD that applies to all RTs and an array of up to 8 elements, each of which contains the two DWords for each. The start of each element is spaced 2 DWords apart. The blend state is aligned to a 64-byte boundary, which is pointed to by a field in 3DSTATE_BLEND_STATE_POINTERS. The 3-bit Render Target Index field in the Render Target Write data port message header is used to select which of the 8 elements from BLEND_STATE that is used on the current message.

DWord	Bit	Description
0	31	**Alpha To Coverage Enable** Format: Enable If set, Source0 Alpha is converted to a temporary 1/2/4-bit coverage mask and the mask bit corresponding to the sample# ANDed with the sample mask bit. If set, sample coverage is computed based on src0 alpha value. Value of 0 disables all samples and value of 1 enables all samples for that pixel. The same coverage needs to apply to all the RTs in MRT case. Further, any value of src0 alpha between 0 and 1 monotonically increases the number of enabled pixels.The field is applied to all the RTs in MRT case.
	30	**Independent Alpha Blend Enable** Format: Enable When enabled, the other fields in this instruction control the combination of the alpha components in the Color Buffer Blend stage. When disabled, the alpha components are combined in the same fashion as the color components.The field is applied to all the RTs in MRT case.
	29	**Alpha To One Enable** Format: Enable If set, Source0 Alpha is set to 1.0f after (possibly) being used to generate the AlphaToCoverage coverage mask.If Dual Source Blending is enabled, this bit must be disabled.The field is applied to all the RTs in MRT case.
	28	**Alpha To Coverage Dither Enable** Format: Enable If set, sample coverage is computed based on src0 alpha value and it modulates the sample coverage based on screen coordinates. Value of 0 disables all samples and value of 1 enables all samples for that pixel. The same coverage needs to apply to all the RTs in MRT case. Further, any

BLEND_STATE

		value of src0 alpha between 0 and 1 monotonically increases the number of enabled pixels. If AlphaToCoverage is disabled, AlphaToCoverage Dither does not have any impact.The field is applied to all the RTs in MRT case.
	27	**Alpha Test Enable** Format: Enable Enables the AlphaTest function of the Pixel Processing pipeline.The field is applied to all the RTs in MRT case. **Programming Notes** Alpha Test can only be enabled if Pixel Shader outputs a float alpha value. Alpha Test is applied independently on each render target by comparing that render target's alpha value against the alpha reference value. If the alpha test fails, the corresponding pixel write will be supressed only for that render target. The depth/stencil update will occur if alpha test passes for any render target.
	26:24	**Alpha Test Function** Format: 3D_Compare_Function This field specifies the comparison function used in the AlphaTest functionThe field is applied to all the RTs in MRT case.
	23	**Color Dither Enable** Format: Enable Enables dithering of colors (including any alpha component) before they are written to the Color Buffer. The field is applied to all the RTs in MRT case. **Programming Notes** For YUV render target formats, this field must be programmed to 0.
	22:21	**X Dither Offset** Format: U2 Specifies offset to apply to pixel X coordinate LSBs when accessing dither table.The field is applied to all the RTs in MRT case.
	20:19	**Y Dither Offset** Format: U2 Specifies offset to apply to pixel Y coordinate LSBs when accessing dither table.The field is applied to all the RTs in MRT case.
	18:0	**Reserved** Format: MBZ
1..16	63:0	**Entry** Format: BLEND_STATE_ENTRY

BLEND_STATE_ENTRY

BLEND_STATE_ENTRY

Source: BSpec
Size (in bits): 64
Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63	**Logic Op Enable** Format: Enable Enables the LogicOp function of the Pixel Processing pipeline. **Programming Notes** Enabling LogicOp and Color Buffer Blending at the same time is UNDEFINED
	62:59	**Logic Op Function** Format: 3D_Logic_Op_Function This field specifies the function to be performed (when enabled) in the Logic Op stage of the Pixel Processing pipeline. Note that the encoding of this field is one less than the corresponding "R2_" ROP code defined in WINGDI.H, and is a rather contorted mapping of the OpenGL LogicOp encodings. However, this field was defined such that, when the 4 bits are replicated to 8 bits, they coincide with the ROP codes used in the Blter. Note: if the Logic Op Function does not depend on "D", the dest buffer is not read.
	58:37	**Reserved** Format: MBZ
	36	**Pre-Blend Source Only Clamp Enable** Format: Enable This field specifies whether the source(s) are clamped prior to blending, regardless of whether blending is enabled. If DISABLED, no clamping is performed prior to blending. If ENABLED, only source0 and source 1, if dual source is enabled, are clamped prior to the blend to the range specified by Color Clamp Range. **Value / Name / Description** 0 / Disabled / No clamping is performed prior to blending. 1 / Enabled / Only Source(s) are clamped prior to blend function. Other inputs to blend must be clamped according to the behavior specified for "pre-blend color clamp disable" in the pre-blend color clamping table . **Programming Notes** This field is ignored (treated as DISABLED) for UINT and SINT RT surface formats. Blending is not supported for those RT surface formats. **When this bit is enabled Pre-Blend Color Clamp Enable must be disabled.**

BLEND_STATE_ENTRY

35:34 **Color Clamp Range**

Specifies the clamped range used in Pre-Blend and Post-Blend Color Clamp functions if one or both of those functions are enabled. Note that this range selection is shared between those functions. This field is ignored if both of the Color Clamp Enables are disabled

Value	Name	Description
0	COLORCLAMP_UNORM	Clamp Range [0,1]
1	COLORCLAMP_SNORM	Clamp Range [-1,1]
2	COLORCLAMP_RTFORMAT	Clamp to the range of the RT surface format (Note: The Alpha component is clamped to FLOAT16 for R11G11B10_FLOAT format). Unsigned Floating Point components are clamped to positive zero.
3	Reserved	Reserved

33 **Pre-Blend Color Clamp Enable**

Format:	Enable

This field specifies whether the source, destination and constant color channels are clamped prior to blending, regardless of whether blending is enabled.If DISABLED, no clamping is performed prior to blending.If ENABLED, all inputs to the blend function are clamped prior to the blend to the range specified by Color Clamp Range.

Value	Name	Description
0	Disabled	No clamping is performed prior to blending.
1	Enabled	All inputs to the blend function are clamped prior to the blend to the range specified by Color Clamp Range.

Programming Notes
See table in Pre-Blending Color Clamp subsection for programming restrictions as a function of RT format. This field is ignored (treated as DISABLED) for UINT and SINT RT surface formats. Blending is not supported for those RT surface formats. The device will automatically clamp source color channels to the respective RT surface range.

32 **Post-Blend Color Clamp Enable**

Format:	Enable

Regardless of whether this clamping is enabled, the blending output channels will be clamped to the RT surface format just prior to being written.

Programming Notes
This field is ignored (treated as DISABLED) for UINT and SINT RT surface formats. Blending is not supported for those RT surface formats. Post Blend Clamp Enable must be programmed identical to Pre Blend Clamp Enable. The device will automatically clamp source color channels to the respective RT surface range. **When this bit is enabled Pre-Blend Source Only Clamp Enable must be disabled.**

BLEND_STATE_ENTRY

	31	**Color Buffer Blend Enable** Format: Enable Enables the ColorBufferBlending (nee "alpha blending") function of the Pixel Processing Pipeline for this render target. **Programming Notes** Enabling LogicOp and ColorBufferBlending at the same time is UNDEFINED
	30:26	**Source Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Controls the "source factor" in the ColorBufferBlending function.Refer to Source Alpha Blend Factor for encodings.
	25:21	**Destination Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Controls the "destination factor" in the ColorBufferBlending function. Refer to Source Alpha Blend Factor for encodings.
	20:18	**Color Blend Function** Format: 3D_Color_Buffer_Blend_Function This field specifies the function used to combine the color components in the ColorBufferBlending function of the Pixel Processing Pipeline. If Independent Alpha Blend Enable is disabled, this field will also control the blending of the alpha components in the ColorBufferBlending function.
	17:13	**Source Alpha Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Controls the "source factor" in alpha Color Buffer Blending stage.Note: For the source/destination alpha blend factors, the encodings indicating "COLOR" are the same as the encodings indicating "ALPHA", as the alpha component of the color is selected.
	12:8	**Destination Alpha Blend Factor** Format: 3D_Color_Buffer_Blend_Factor Controls the "destination factor" in alpha Color Buffer Blending stage. Refer to Source Alpha Blend Factor for encodings.
	7:5	**Alpha Blend Function** Format: 3D_Color_Buffer_Blend_Function This field specifies the function used to combine the alpha components in the Color Buffer blend stage of the Pixel Pipeline when the IndependentAlphaBlend state is enabled.

BLEND_STATE_ENTRY

	4	**Reserved** Format: MBZ
	3	**Write Disable Alpha** Format: Disable This field controls the writing of the alpha component into the Render Target. **Value** / **Name** / **Description** 0b / Enabled / Alpha component can be overwritten 1b / Disabled / Writes to the color buffer will not modify Alpha. **Programming Notes** For YUV surfaces, this field must be set to 0B (enabled).
	2	**Write Disable Red** Format: Disable This field controls the writing of the red component into the Render Target. **Value** / **Name** / **Description** 0b / Enabled / Red component can be overwritten 1b / Disabled / Writes to the color buffer will not modify Red. **Programming Notes** For YUV surfaces, this field must be set to 0B (enabled).
	1	**Write Disable Green** Format: Disable This field controls the writing of the green component into the Render Target. **Value** / **Name** / **Description** 0b / Enabled / Green component can be overwritten 1b / Disabled / Writes to the color buffer will not modify Green. **Programming Notes** For YUV surfaces, this field must be set to 0B (enabled).

BLEND_STATE_ENTRY

0 **Write Disable Blue**

Format:	Disable

This field controls the writing of the Blue component into the Render Target.

Value	Name	Description
0b	Enabled	Blue component can be overwritten
1b	Disabled	Writes to the color buffer will not modify Blue.

Programming Notes
For YUV surfaces, this field must be set to 0B (enabled).

Block Dimensions Message Header Control

MHC_BDIM - Block Dimensions Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:22	**Reserved** Format: Ignore Ignored
	21:20	**Block Height** Format: Enumeration Height in rows of block being accessed. Range = [0,3] representing 1 to 8 rows.

Value	Name	Description
0h	H1	Block height = 1 row
1h	H2	Block height = 2 rows
2h	H4	Block height = 4 rows
03h	H8	Block height = 8 rows

DWord	Bit	Description
	19:2	**Reserved** Format: Ignore Ignored
	1:0	**Block Width** Format: Enumeration Width in Dwords of block being accessed. Range = [0,3] representing 1 to 8 Dwords.

Value	Name	Description
0h	W1	Block width = 1 Dword
1h	W2	Block width = 2 Dwords
2h	W4	Block width = 4 Dwords
03h	W8	Block width = 8 Dwords

Block Message Header

MH_BTS_GO - Block Message Header

Source: DataPort 0

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:0	**Reserved** Format: Ignore Ignored
2	31:0	**Global Offset** Format: U32 Specifies the global element index into the buffer, in units of Hwords, Owords, Dwords, or Bytes (depending on the message). **Programming Notes** The Global Offset for the Aligned Block operations is specified as a Dword-aligned byte offset (offset bits [1:0] = 0), Oword-aligned byte offset (offset bits [3:0]=0), or Hword-aligned byte offset (offset bits [4:0]=0). If the address offset calculated with the Global Offset is greater than the Surface Size, then the access is Out-of-Bounds.
3..7	159:0	**Reserved** Format: Ignore Ignored

BR00 - BLT Opcode and Control

BR00 - BLT Opcode and Control

Source: BlitterCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31	**BLT Engine Busy** This bit indicates whether the BLT Engine is busy (1) or idle (0). This bit is replicated in the SETUP BLT Opcode and Control register. Value: 0 — Name: Idle **[Default]** Value: 1 — Name: Busy
	30	**Setup Instruction Instruction** Default Value: 0 The current instruction performs clipping (1).
	29	**Setup Monochrome Pattern** This bit is decoded from the Setup instruction opcode to identify whether a color (0) or monochrome (1) pattern is used with the SCANLINE_BLT instruction. Value: 0 — Name: Color **[Default]** Value: 1 — Name: Monochrome
	28:22	**Instruction Target (Opcode)** Default Value: 0000000b This is the contents of the Instruction Target field from the last BLT instruction. This field is used by the BLT Engine state machine to identify the BLT instruction it is to perform. The opcode specifies whether the source and pattern operands are color or monochrome.
	21:20	**32bpp Byte Mask** This field is only used for 32bpp. Value: 00b — Name: **[Default]** Value: 1xb — Name: Write Alpha Channel Value: x1b — Name: Write RGB Channel

BR00 - BLT Opcode and Control

19:17 Monochrome Source Start

Default Value:	000b

This field indicates the starting monochrome pixel bit position within a byte per scan line of the source operand. The monochrome source is word aligned which means that at the end of the scan line all bits should be discarded until the next word boundary.

16 Bit/Byte Packed

Byte packed is for the NT driver.

Value	Name
0b	Bit **[Default]**
1b	Byte

15 Src Tiling Enable

Value	Name
0b	Tiling Disabled (Linear) **[Default]**
1b	Tiling enabled: Tile-X or Tile-Y

14:12 Horizontal Pattern Seed

Default Value:	0b

This field indicates the pattern pixel position which corresponds to X = 0.

11 Dest Tiling Enable

When set to '1', this means that Blitter is executing in Tiled mode. If '0' it means that Blitter is in Linear mode. Pre-Dev Blitter never executes in Tiled-Y mode, DevGT+ Blitter supports both Tile-X and Tile-Y modes. On reset, this bit will be '0'. This definition applies to only X, Y Blits.

Value	Name
0b	Tiling Disabled (Linear blit) **[Default]**
1b	Tiling enabled: Tile-X or Tile-Y

10:8 Transparency Range Mode

These bits control whether or not the byte(s) at the destination corresponding to a given pixel will be conditionally written, and what those conditions are. This feature can make it possible to perform various masking functions in order to selectively write or preserve graphics data already at the destination.

Value	Name	Description
xx0b	**[Default]**	No color transparency mode enabled. This causes normal operation with regard to writing data to the destination.

BR00 - BLT Opcode and Control

		001b		[Source color transparency] The Transparency Color Low: (Pixel Greater or Equal) (source background register) and the Transparency Color High: (Pixel Less or Equal) (source foreground register) are compared to the source pixels. The range comparisons are done on each component (R, G, B) and then logically ANDed. If the source pixel components are not within the range defined by the Transparency Color registers, then the byte(s) at the destination corresponding to the current pixel are written with the result of the bit-wise operation.
		011b		[Source and Alpha color transparency] The Transparency Color Low: (Pixel Greater or Equal) (source background register) and the Transparency Color High: (Pixel Less or Equal) (source foreground register) are compared to the source pixels. The range comparisons are done on each component (A, R, G, B) and then logically ANDed. If the source pixel components are not within the range defined by the Transparency Color registers, then the byte(s) at the destination corresponding to the current pixel are written with the result of the bit-wise operation."
		101b		[Destination and Alpha color transparency] The Transparency Color Low: (Pixel Greater or Equal) (source background register) and the Transparency Color High: (Pixel Less or Equal) (source foreground register) are compared to the destination pixels. The range comparisons are done on each component (A, R, G, B) and then logically ANDed. If the destination pixels are within the range, then the byte(s) at the destination corresponding to the current pixel are written with the result of the bit-wise operation.
		111b		[Destination color transparency] The Transparency Color Low: (Pixel Greater or Equal) (source background register) and the Transparency Color High: (Pixel Less or Equal) (source foreground register) are compared to the destination pixels. The range comparisons are done on each component (R, G, B) and then logically ANDed. If the destination pixels are within the range, then the byte(s) at the destination corresponding to the current pixel are written with the result of the bit-wise operation.
	7:5	**Pattern Vertical Seed**		
		Default Value:	000b	
		This field specifies the pattern scan line which corresponds to Y=0.		
	4	**Destination Read Modify Write**		
		Default Value:	0b	
		This bit is decoded from the last instruction's opcode field and Destination Transparency Mode to identify whether a Destination read is needed.		

BR00 - BLT Opcode and Control

	3	**Color Source** Default Value: 0b This bit is decoded from the last instructions opcode field to identify whether a color (1) source is used.
	2	**Monochrome Source** Default Value: 0b This bit is decoded from the last instructions opcode field to identify whether a monochrome (1) source is used.
	1	**Color Pattern** Default Value: 0b This bit is decoded from the last instructions opcode field to identify whether a color (1) pattern is used.
	0	**Monochrome Pattern** Default Value: 0b This bit is decoded from the last instructions opcode field to identify whether a monochrome (1) pattern is used.

BR01 - Setup BLT Raster OP, Control, and Destination Offset

BR01 - Setup BLT Raster OP, Control, and Destination Offset

Source: BlitterCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31	**Solid Pattern Select** This bit applies only when the pattern data is monochrome. This bit determines whether or not the BLT Engine actually performs read operations from the frame buffer in order to load the pattern data. Use of this feature to prevent these read operations can increase BLT Engine performance, if use of the pattern data is indeed not necessary. The BLT Engine is configured to accept either monochrome or color pattern data via the opcode field.

Value	Name	Description
0b	**[Default]**	This causes normal operation with regard to the use of the pattern data. The BLT Engine proceeds with the process of reading the pattern data, and the pattern data is used as the pattern operand for all bit-wise operations.
1b		The BLT Engine forgoes the process of reading the pattern data, the presumption is made that all of the bits of the pattern data are set to 0, and the pattern operand for all bit-wise operations is forced to the background color specified in the Color Expansion Background Color Register.

	30	**Clipping Enabled**

Value	Name
0b	**[Default]**
1b	

	29	**Monochrome Source Transparency Mode** This bit applies only when the source data is in monochrome. This bit determines whether or not the byte(s) at the destination corresponding to the pixel to which a given bit of the source data also corresponds will actually be written if that source data bit has the value of 0. This feature can make it possible to use the source as a transparency mask. The BLT Engine is configured to accepted either monochrome or color source data via the opcode field.

Value	Name	Description
0b	**[Default]**	This causes normal operation with regard to the use of the source data. Wherever a bit in the source data has the value of 0, the color specified in the background color register is used as the source operand in the bit-wise operation for the pixel corresponding to the source data bit, and the bytes at the destination corresponding to that pixel are written with the result.
1b		Wherever a bit in the source data has the value of 0, the byte(s) at the destination corresponding to the pixel to which the source data bit also corresponds are simply not written, and the data at those byte(s) at the destination are allowed to remain unchanged.

BR01 - Setup BLT Raster OP, Control, and Destination Offset

28 **Monochrome Pattern Transparency Mode**

This bit applies only when the pattern data is monochrome. This bit determines whether or not the byte(s) at the destination corresponding to the pixel to which a given bit of the pattern data also corresponds will actually be written if that pattern data bit has the value of 1. This feature can make it possible to use the pattern as a transparency mask. The BLT Engine is configured to accepted either monochrome or color pattern data via the opcode field.

Value	Name	Description
0b	**[Default]**	This causes normal operation with regard to the use of the pattern data. Wherever a bit in the pattern data has the value of 0, the color specified in the background color register is used as the pattern operand in the bit-wise operation for the pixel corresponding to the pattern data bit, and the bytes at the destination corresponding to that pixel are written with the result.
1b		Wherever a bit in the pattern data has the value of 0, the byte(s) at the destination corresponding to the pixel to which the pattern data bit also corresponds are simply not written, and the data at those byte(s) at the destination are allowed to remain unchanged.

27:26 **32bpp Byte Mask**

This bit applies only when the pattern data is monochrome. This bit determines whether or not the byte(s) at the destination corresponding to the pixel to which a given bit of the pattern data also corresponds will actually be written if that pattern data bit has the value of 1. This feature can make it possible to use the pattern as a transparency mask. The BLT Engine is configured to accepted either monochrome or color pattern data via the opcode field.

Value	Name
00b	**[Default]**
1xb	Write Alpha Channel
x1b	Write RGB Channel

25:24 **Color Depth**

Value	Name
00b	8 Bit Color Depth **[Default]**
01b	16 Bit Color Depth
10b	Alternate 16 Bit Color Depth
11b	32 Bit Color Depth

23:16 **Raster Operation Select**

These 8 bits are used to select which one of 256 possible raster operations is to be performed by the BLT Engine.

15:0 **Destination Pitch (Offset)**

For non-XY Blits, the signed 16bit field allows for specifying upto + 32Kbytes signed pitches in bytes (same as before). For X, Y Blits with tiled-X surfaces, the pitch for Destination will be 512Byte aligned and should be programmable upto + 128Kbytes. For X, Y Blits with tiled-Y surfaces, the pitch for Destination will be 128Byte aligned and should be programmable upto + 128Kbytes. In this case, this 16bit signed pitch field is used to specify upto + 32KDWords. For X, Y

BR01 - Setup BLT Raster OP, Control, and Destination Offset		
		blits with nontiled surfaces (linear surfaces), this 16bit field can be programmed to byte specification of upto + 32Kbytes (same as before). These 16 bits store the signed memory address offset value by which the destination address originally specified in the Destination Address Register is incremented or decremented as each scan line's worth of destination data is written into the frame buffer by the BLT Engine, so that the destination address will point to the next memory address to which the next scan line's worth of destination data is to be written. If the intended destination of a BLT operation is within on-screen frame buffer memory, this offset is normally set so that each subsequent scan line's worth of destination data lines up vertically with the destination data in the scan line, above. However, if the intended destination of a BLT operation is within off-screen memory, this offset can be set so that each subsequent scan line's worth of destination data is stored at a location immediately after the location where the destination data for the last scan line ended, in order to create a single contiguous block of bytes of destination data at the destination.

BR05 - Setup Expansion Background Color

BR05 - Setup Expansion Background Color		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Setup Expansion Background Color Bits** These bits provide the one, two, or four bytes worth of color data that select the background color to be used in the color expansion of monochrome pattern or source data for either the SCANLINE_BLT or TEXT_BLT instructions. BR05 is also used as the solid pattern for the PIXEL_BLT instruction. Whether one, two, or three bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.

BR06 - Setup Expansion Foreground Color

BR06 - Setup Expansion Foreground Color		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Setup Expansion Foreground Color Bits** These bits provide the one, two, or four bytes worth of color data that select the foreground color to be used in the color expansion of monochrome pattern or source data for either the SCANLINE_BLT or TEXT_BLT instructions. Whether one, two, or three bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.

BR07 - Setup Blit Color Pattern Address Lower Order Address bits

BR07 - Setup Blit Color Pattern Address Lower Order Address bits

Source: BlitterCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:6	**Setup Blit Color Pattern Address** Format: GraphicsAddress[31:6] Lower 32bits of the 48bit addressing. These 26 bits specify the starting address of the (8X8) pixel color **pattern from the SETUP_BLT instruction.** This register works identically to the Pattern Address register (BR15), but this version is **only used with the SCANLINE_BLT instruction execution** (the actual programming for this, is done in XY_SETUP_BLT command). The pattern data must be located in linear memory. The pattern data must be located on a pattern-size boundary. The pattern is always of 8x8 pixels, and therefore, its size is dependent upon its pixel depth. The pixel depth may be 8, 16, or 32 bits per pixel if the pattern is in color (the pixel depth of a color pattern must match the pixel depth to which the graphics system has been set). Monochrome patterns require 8 bytes and is supplied through the instruction. Color patterns of 8, 16, and 32 bits per pixel color depth must start on 64-byte, 128-byte and 256-byte boundaries, respectively. The Pattern Base Address programmed, must always be Cache Line (64byte) aligned.
	5:0	**Reserved** Format: MBZ

BR09 - Destination Address Lower Order Address Bits

BR09 - Destination Address Lower Order Address Bits		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Destination Address Bits** Format: GraphicsAddress[31:0] When tiling is enabled for XY-blits, this base address should be limited to 4KB. when tiling is disabled for XY-blits, this base address should be CL (64byte) aligned. These lower 32bits of the 48bit address, which specify the starting pixel address of the destination data. This register is also the working destination address register for the lower 32bits of the address, and changes as the BLT Engine performs the accesses. Used as the scan line address (Destination Y Address and Destination Y1 Address) for BLT instructions: PIXEL_BLT, SCANLINE_BLT, and TEXT_BLT. In this case the address points to the first pixel in a scan line and is compared with the ClipRect Y1 and Y2 address registers to determine whether the scan line should be written or not. The Destination Y1 address is the top scan line to be written for text. Note that for non-XY blits (COLOR_BLT, SRC_COPY_BLT), this address points to the first byte to be written. Note: Some instructions affect only one scan line (requiring only one coordinate); other instructions affect multiple scan lines and need both coordinates.

BR11 - BLT Source Pitch (Offset)

BR11 - BLT Source Pitch (Offset)		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:16	**Reserved**
	15:0	**Source Pitch (Offset)** For non-XY Blits with color source operand (SRC_COPY_BLT), the signed 16bit field allows for specifying upto + 32Kbytes signed pitch in bytes (same as before). For X, Y Blits with tiled-X surfaces, the pitch for Color Source will be 512Byte aligned and should be programmable upto + 128Kbytes. For X, Y Blits with tiled-Y surfaces, the pitch for Color Source will be 128Byte aligned and should be programmable upto + 128Kbytes. In this case, this 16bit signed pitch field is used to specify upto + 32KDWords. For X, Y blits with nontiled color source surfaces (linear surfaces), this 16bit field can be programmed to byte specification of upto + 32Kbytes (same as before). When the color source data is located within the frame buffer or AGP aperture, these signed 16 bits store the memory address offset (pitch) value by which the source address originally specified in the Source Address Register is incremented or decremented as each scan line's worth of source data is read from the frame buffer by the BLT Engine, so that the source address will point to the next memory address from which the next scan line's worth of source data is to be read. Note that if the intended source of a BLT operation is within on-screen frame buffer memory, this offset is normally set to accommodate the fact that each subsequent scan line's worth of source data lines up vertically with the source data in the scan line, above. However, if the intended source of a BLT operation is within off-screen memory, this offset can be set to accommodate a situation in which the source data exists as a single contiguous block of bytes where in each subsequent scan line's worth of source data is stored at a location immediately after the location where the source data for the last scan line ended.

BR12 - Source Address Lower order Address bits

BR12 - Source Address Lower order Address bits		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Source Address Bits** Format: GraphicsAddress[31:0] Lower 32bits of the 48bit addressing. When tiling is enabled for XY-blits with Color source surfaces, this base address should be aligned to 4KB. When tiling is disabled for XY-blits, this base address should be CL (64byte) aligned. Note that for non-XY blit with Color Source (SRC_COPY_BLT), this address points to the first byte to be read. These lower 32bits of the 48bit address, specify the starting pixel address of the color source data. The lower 3 bits are used to indicate the position of the first valid byte within the first Quadword of the source data. If this Source happens to be a Monosource surface, then this Monosource Base Address programmed, must always be Cache Line (64byte) aligned.

BR13 - BLT Raster OP, Control, and Destination Pitch

BR13 - BLT Raster OP, Control, and Destination Pitch

Source: BlitterCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31	**Solid Pattern Select** This bit applies only when the pattern data is monochrome. This bit determines whether or not the BLT Engine actually performs read operations from the frame buffer in order to load the pattern data. Use of this feature to prevent these read operations can increase BLT Engine performance, if use of the pattern data is indeed not necessary. The BLT Engine is configured to accept either monochrome or color pattern data via the opcode field.

Value	Name	Description
0	**[Default]**	This causes normal operation with regard to the use of the pattern data. The BLT Engine proceeds with the process of reading the pattern data, and the pattern data is used as the pattern operand for all bit-wise operations.
1		The BLT Engine forgoes the process of reading the pattern data, the presumption is made that all of the bits of the pattern data are set to 0, and the pattern operand for all bit-wise operations is forced to the background color specified in the Color Expansion Background Color Register.

30	**Clipping Enabled**
Default Value:	0

29	**Monochrome Source Transparency Mode** This bit applies only when the source data is in monochrome. This bit determines whether or not the byte(s) at the destination corresponding to the pixel to which a given bit of the source data also corresponds will actually be written if that source data bit has the value of 0. This feature can make it possible to use the source as a transparency mask. The BLT Engine is configured to accepted either monochrome or color source data via the opcode field.

Value	Name	Description
0	**[Default]**	This causes normal operation with regard to the use of the source data. Wherever a bit in the source data has the value of 0, the color specified in the background color register is used as the source operand in the bit-wise operation for the pixel corresponding to the source data bit, and the bytes at the destination corresponding to that pixel are written with the result.
1		Where a bit in the source data has the value of 0, the byte(s) at the destination corresponding to the pixel to which the source data bit also corresponds are simply not written, and the data at those byte(s) at the destination are allowed to remain unchanged.

BR13 - BLT Raster OP, Control, and Destination Pitch

28 **Monochrome Pattern Transparency Mode**

This bit applies only when the pattern data is monochrome. This bit determines whether or not the byte(s) at the destination corresponding to the pixel to which a given bit of the pattern data also corresponds will actually be written if that pattern data bit has the value of 1. This feature can make it possible to use the pattern as a transparency mask. The BLT Engine is configured to accepted either monochrome or color pattern data via the opcode in the Opcode and Control register.

Value	Name	Description
0	**[Default]**	This causes normal operation with regard to the use of the pattern data. Where a bit in the pattern data has the value of 0, the color specified in the background color register is used as the pattern operand in the bit-wise operation for the pixel corresponding to the pattern data bit, and the bytes at the destination corresponding to that pixel are written with the result.
1		Wherever a bit in the pattern data has the value of 0, the byte(s) at the destination corresponding to the pixel to which the pattern data bit also corresponds are simply not written, and the data at those byte(s) at the destination are allowed to remain unchanged.

27:26 **32bpp Byte Mask**

This field is only used for 32bpp.

Value	Name
00b	**[Default]**
1xb	Write Alpha Channel
x1b	Write RGB Channel

25:24 **Color Depth**

Value	Name
00b	8 Bit Color Depth **[Default]**
01b	16 Bit Color Depth
10b	24 Bit Color Depth
11b	Reserved

23:16 **Raster Operation Select**

Default Value:	00000000b

These 8 bits are used to select which one of 256 possible raster operations is to be performed by the BLT Engine.

BR13 - BLT Raster OP, Control, and Destination Pitch		
	15:0	**Destination Pitch(Offset)** These 16 bits store the signed memory address offset value by which the destination address originally specified in the Destination Address Register is incremented or decremented as each scan line's worth of destination data is written into the frame buffer by the BLT Engine, so that the destination address will point to the next memory address to which the next scan line's worth of destination data is to be written. If the intended destination of a BLT operation is within on-screen frame buffer memory, this offset is normally set so that each subsequent scan line's worth of destination data lines up vertically with the destination data in the scan line, above. However, if the intended destination of a BLT operation is within off-screen memory, this offset can be set so that each subsequent scan line's worth of destination data is stored at a location immediately after the location where the destination data for the last scan line ended, in order to create a single contiguous block of bytes of destination data at the destination.

BR14 - Destination Width and Height

BR14 - Destination Width and Height		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
BR14 contains the values for the height and width of the data to be BLT. If these values are not correct, such that the BLT Engine is either expecting data it does not receive or receives data it did not expect, the system can hang.		
DWord	**Bit**	**Description**
0	31:29	**Reserved**
	28:16	**Destination Height** These 13 bits specify the height of the destination data in terms of the number of scan lines. This is a working register.
	15:13	**Reserved**
	12:0	**Destination Byte Width** These 13 bits specify the width of the destination data in terms of the number of bytes per scan line. The number of pixels per scan line into which this value translates depends upon the color depth to which the graphics system has been set.

BR15 - Color Pattern Address Lower order Address bits

BR15 - Color Pattern Address Lower order Address bits

Source: BlitterCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:6	**Color Pattern Address** Format: GraphicsAddress[31:6] Lower 32bits of the 48bit addressing. There is no change to the Color Pattern address specification due to Non-Power-of-2 change. It remains the same as before. The pattern data must be located in linear memory. These 26 bits specify the starting address of the (8X8) pixel color pattern. The pattern data must be located on a pattern-size boundary. The pattern is always of 8x8 pixels, and therefore, its size is dependent upon its pixel depth. The pixel depth may be 8, 16, or 32 bits per pixel if the pattern is in color (the pixel depth of a color pattern must match the pixel depth to which the graphics system has been set). Monochrome patterns require 8 bytes and are applied through the instruction. Color patterns of 8, 16, and 32 bits per pixel color depth must start on 64-byte, 128-byte and 256-byte boundaries, respectively. The Pattern Base Address programmed, must always be Cache Line (64byte) aligned.

BR18 - Source Expansion Background and Destination Color

BR18 - Source Expansion Background and Destination Color		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Source Expansion Background Color Bits** These bits provide the one, two, or four bytes worth of color data that select the background color to be used in the color expansion of monochrome source data during BLT operations. This register is also used to support destination transparency mode and Solid color fill. Whether one, two, three, or four bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.

BR19 - Source Expansion Foreground Color

BR19 - Source Expansion Foreground Color		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Pattern/Source Expansion Foreground Color Bits** These bits provide the one, two, or four bytes worth of color data that select the foreground color to be used in the color expansion of monochrome source data during BLT operations. Whether one, two, or four bytes worth of color data is needed depends upon the color depth to which the BLT Engine has been set. For a color depth of 32bpp, 16bpp and 8bpp, bits [31:0], [15:0] and [7:0], respectively, are used.

BR27 - Destination Higher Order Address

BR27 - Destination Higher Order Address

Source:	BlitterCS
Size (in bits):	32
Default Value:	0x00000000

Upper 32 bits of the starting pixel address for the destination data. This structure is also the working location for the upper bits of the destination address, and changes as the BLT Engine performs the accesses. See BR09 for the lower 32 bits. When tiling is enabled for XY-blits, this base address should be limited to 4KB. Otherwise for XY blits, there is no restriction and it is same as before.

Used as the scan line address (Destination Y Address and Destination Y1 Address) for BLT instructions: PIXEL_BLT, SCANLINE_BLT, and TEXT_BLT. In this case the address points to the first pixel in a scan line and is compared with the ClipRect Y1 and Y2 address registers to determine whether the scan line should be written or not. The Destination Y1 address is the top scan line to be written for text.

Note that for non-XY blits (COLOR_BLT, SRC_COPY_BLT), the destination address points to the first byte to be written. This structure is always the last location written for a BLT drawing instruction. Writing to BR27 starts the BLT engine execution. Note: Some instructions affect only one scan line (requiring only one coordinate); other instructions affect multiple scan lines and need both coordinates.

GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The uppermost reserved bits are ignored and MBZ.

DWord	Bit	Description
0	31:16	**Reserved** Format: MBZ
	15:0	**Destination Address Upper DWORD** Format: GraphicsAddress[47:32]

BR28 - Source Higher Order Address

BR28 - Source Higher Order Address			
Source:	BlitterCS		
Size (in bits):	32		
Default Value:	0x00000000		
DWord		**Bit**	**Description**
0 Upper 32 bits of the Source address, specifying the starting pixel address of the color or mono source data. When tiling is enabled for XY-blits with Color source surfaces, this base address should be limited to 4KB. Otherwise for XY blits, there is no restriction and it is same as before, including for monosource and text blits. Note that for non-XY blit with Color Source (SRC_COPY_BLT), this address points to the first byte to be read. GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The uppermost reserved bits are ignored and MBZ.		31:16	**Reserved** Format: MBZ
		15:0	**Source Address Upper DWORD** Format: GraphicsAddress[47:32]

BR29 - Color Pattern Higher Order Address

BR29 - Color Pattern Higher Order Address			
Source:	BlitterCS		
Size (in bits):	32		
Default Value:	0x00000000		
DWord		**Bit**	**Description**
0 Upper 32 bits of the Color Pattern address, specifying the starting location of the (8X8) pixel pattern. GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The uppermost reserved bits are ignored and MBZ.		31:16	**Reserved** Format: MBZ
		15:0	**Color Pattern Address Upper DWORD** Format: GraphicsAddress[47:32]

BR30 - Setup Blit Color Pattern Higher Order Address

BR30 - Setup Blit Color Pattern Higher Order Address		
Source:	BlitterCS	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0 Upper 32 bits of the Color Pattern address, specifying the starting location of the (8X8) pixel pattern. GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The uppermost reserved bits are ignored and MBZ.	31:16	**Reserved** Format: MBZ
	15:0	**Setup Blit Color Pattern Upper DWORD** Format: GraphicsAddress[47:32]

Byte Masked Media Block Message Header

MH_MBBM - Byte Masked Media Block Message Header

Source: DataPort 1

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**X Offset** Format: S31 X offset (in bytes) of the upper left corner of the block into the surface. **Programming Notes** Must be DWord aligned (Bits 1:0 MBZ) for the write form of the message.
1	31:0	**Y Offset** Format: S31 Y offset (in rows) of the upper left corner of the block into the surface.
2	31:0	**Media Block Message Control** Format: MHC_MBBM_CONTROL Specifies the Byte Masked message subtype and its additional input parameters.
3	31:0	**Byte Mask** Format: U32 Specifies the Byte Mask for writes when Message Mode field is BYTE_MASK. **Programming Notes** The Byte mask applies horizontally to each row of output: bit 0 for byte 0, through bit 31 for byte 31.
4	31:0	**FFTID** Format: MHC_FFTID Fixed Function Thread ID
5..7	95:0	**Reserved** Format: Ignore Ignored

Byte Masked Media Block Message Header Control

MHC_MBBM_CONTROL - Byte Masked Media Block Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:30	**Message Mode** Format: Enumeration Specifies the Media Block Write Message subtype is Byte Masked. Value / Name / Description: 02h / BYTE_MASK / The Block Height and Block Width fields are specified in this Dword. The Byte Mask qualifies which bytes are written. Others / Reserved / Reserved.
	29	**Reserved** Format: Ignore Ignored
	28:24	**Sub-Register Offset** Format: U5 This field is ignored (reserved) for Media Block Write message.
	23:22	**Reserved** Format: Ignore Ignored
	21:16	**Block Height** Format: U6 Height in rows of block being accessed. Range = [0,63] representing 1 to 64 rows Restriction Restriction : If Block Width (bytes), then Maximum Block Height (rows) is constrained by (# Dwords width) * (# rows) <= 64 Dwords.
	15:10	**Reserved** Format: Ignore Ignored

MHC_MBBM_CONTROL - Byte Masked Media Block Message Header Control

	9:8	**Register Pitch Control** Format: U2 This field is ignored (reserved) for a Media Block Write message.
	7:6	**Reserved** Format: Ignore Ignored
	5:0	**Block Width** Format: U6 Width in bytes of the block being accessed. Range = [0,31] representing 1 to 32 Bytes. **Programming Notes** Must be DWord aligned for Media Block Write message.

CC_VIEWPORT

CC_VIEWPORT

Source: BSpec
Size (in bits): 64
Default Value: 0x00000000, 0x00000000

The viewport state is stored as an array of up to 16 elements, each of which contains the DWords described here. The start of each element is spaced 2 DWords apart. The first element of the viewport state array is aligned to a 32-byte boundary. The Minimum and Maximum Depth legal value ranges are dependant on the depth buffer format.

DWord	Bit	Description
0	31:0	**Minimum Depth** Format: IEEE_Float Indicates the minimum depth. The interpolated or computed depth is clamped to this value prior to the depth test. **Programming Notes** The Minimum depth value must be less-than-or-equal to the Maximum depth value. The Minimum depth value cannot be NAN (Not-A-Number). For All depth formats:Minimum depth value must not be less than 0.0, also it may not be -0.0 (negative zero)
1	31:0	**Maximum Depth** Format: IEEE_Float Indicates the maximum depth. The interpolated or computed depth is clamped to this value prior to the depth test. **Programming Notes** The Maximum depth value cannot be smaller than Minimum depth value. The Maximum depth value cannot be NAN (Not-A-Number). For all depth formats: The Maximum depth value must be between +0.0to +1.0.

Channel Mask Message Descriptor Control Field

MDC_CMASK - Channel Mask Message Descriptor Control Field

Source: BSpec
Size (in bits): 4
Default Value: 0x00000000

DWord	Bit	Description
0	3:0	**Mask** Format: Enumeration For the read message, indicates that which channels are read from the surface and included in the writeback message. For the write message, indicates which channels are included in the message payload and written to the surface.

Value	Name	Description
00h	RGBA **[Default]**	Red, Green, Blue, and Alpha are included
01h	GBA	Green, Blue, and Alpha are included
02h	RBA	Red, Blue, and Alpha are included
03h	BA	Blue and Alpha are included
04h	RGA	Red, Green, and Alpha are included
05h	GA	Green and Alpha are included
06h	RA	Red and Alpha are included
07h	A	Alpha is included
08h	RGB	Red, Green, and Blue are included
09h	GB	Green and Blue are included
0Ah	RB	Red and Blue are included
0Bh	B	Blue is included
0Ch	RG	Red and Green are included
0Dh	G	Green is included
0Eh	R	Red is included
0Fh	Reserved	Ignored

Channel Mode Message Descriptor Control Field

MDC_CMODE - Channel Mode Message Descriptor Control Field

Source: BSpec
Size (in bits): 1
Default Value: 0x00000000

DWord	Bit	Description
0	0	**Channel Mode** Format: Enumeration Two modes of channel-enable are provided: a SIMD8 or SIMD16 Dword channel serial view of a register, and a SIMD4x2 view of a register.

Value	Name	Description
0	Oword	All 4 Dwords are read or written if one or more of these channels are enabled
1	Dword	Each Dword is read or written only if its corresponding channel is enabled.

Clock Gating Disable Format

Clock Gating Disable Format		
Source:	BSpec	
Size (in bits):	1	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	0	**Clock_Gate_Disable**

Value	Name	Description
0b	Enable	Clock gating controlled by unit logic
1b	Disable	Disable clock gating function

Clock Gating Disable Format

Clock Gating Disable Format

Source: BSpec
Size (in bits): 1
Default Value: 0x00000000

DWord	Bit	Description
0	0	**Clock Gate Disable**

Value	Name	Description
0b	Enable	Clock gating controlled by unit enabling logic
1b	Disable	Disable clock gating function

COLOR_CALC_STATE

COLOR_CALC_STATE

Source: BSpec
Size (in bits): 192
Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

This definition is pointed to by a field in 3DSTATE_CC_STATE_POINTERS, and stored at a 64-byte aligned boundary.

DWord	Bit	Description
0	31:16	**Reserved** Format: MBZ
	15	**Round Disable Function Disable** Format: Disable Disables the round-disable function of the color calculator. Value 0 – Name: Cancelled – Description: Dithering is cancelled based on the data used by blend to avoid drift. Value 1 – Name: Not Cancelled – Description: Dithering is NOT cancelled.
	14:1	**Reserved** Format: MBZ
	0	**Alpha Test Format** This field selects the format for Alpha Reference Value and the format in which Alpha Test is performed. Value 0h – Name: ALPHATEST_UNORM8 – Description: UNorm8 Value 1h – Name: ALPHATEST_FLOAT32 – Description: Float32 **Programming Notes** Alpha-test format is independent of RT format. When PS outputs UNIT/SINT alpha-value, it will be treated as IEEE 32bit float number for the purpose of alpha-test.
1	31:0	**Alpha Reference Value As UNORM8** Exists If: [Alpha Test Format] == 'ALPHATEST_UNORM8' Format: UNORM8 Upper 24 bits MBZ This field specifies the alpha reference value to compare against in the Alpha Test function.
	31:0	**Alpha Reference Value As FLOAT32** Exists If: [Alpha Test Format] == 'ALPHATEST_FLOAT32' Format: IEEE_Float This field specifies the alpha reference value to compare against in the Alpha Test function.

COLOR_CALC_STATE		
2	31:0	**Blend Constant Color Red** Format: IEEE_Float This field specifies the Red channel of the Constant Color used in Color Buffer Blending.
3	31:0	**Blend Constant Color Green** Format: IEEE_Float This field specifies the Green channel of the Constant Color used in Color Buffer Blending.
4	31:0	**Blend Constant Color Blue** Format: IEEE_Float This field specifies the Blue channel of the Constant Color used in Color Buffer Blending.
5	31:0	**Blend Constant Color Alpha** Format: IEEE_Float This field specifies the Alpha channel of the Constant Color used in Color Buffer Blending.

COLOR_PROCESSING_STATE - ACE State

COLOR_PROCESSING_STATE - ACE State

Source: BSpec

Size (in bits): 416

Default Value: 0x00000068, 0x4C382410, 0x9C887460, 0xEBD8C4B0, 0x604C3824, 0xB09C8874, 0x0000D8C4, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

This state structure contains the ACE state used by the color processing function.
It corresponds to DW29..DW41 of the Color Processing State.

DWord	Bit	Description
0	31:7	**Reserved** Format: MBZ
	6:2	**Skin Threshold** Format: U5 Used for Y analysis (min/max) for pixels which are higher than skin threshold. Value / Name: 1-31 26 **[Default]**
	1	**Full Image Histogram** Default Value: 0 Format: Enable Used to ignore the area of interest for full image histogram.
	0	**ACE Enable** Format: Enable
1	31:24	**Y3** Default Value: 76 Format: U8 The value of the y_pixel for point 3 in PWL.
	23:16	**Y2** Default Value: 56 Format: U8 The value of the y_pixel for point 2 in PWL.

COLOR_PROCESSING_STATE - ACE State

	15:8	**Y1** Default Value: 36 Format: U8 The value of the y_pixel for point 1 in PWL.
	7:0	**Ymin** Default Value: 16 Format: U8 The value of the y_pixel for point 0 in PWL.
2	31:24	**Y7** Default Value: 156 Format: U8 The value of the y_pixel for point 7 in PWL.
	23:16	**Y6** Default Value: 136 Format: U8 The value of the y_pixel for point 6 in PWL.
	15:8	**Y5** Default Value: 116 Format: U8 The value of the y_pixel for point 5 in PWL.
	7:0	**Y4** Default Value: 96 Format: U8 The value of the y_pixel for point 4 in PWL.
3	31:24	**Ymax** Default Value: 235 Format: U8 The value of the y_pixel for point 11 in PWL.
	23:16	**Y10** Default Value: 216 Format: U8 The value of the y_pixel for point 10 in PWL.

COLOR_PROCESSING_STATE - ACE State

	15:8	**Y9** Default Value: 196 Format: U8 The value of the y_pixel for point 9 in PWL.
	7:0	**Y8** Default Value: 176 Format: U8 The value of the y_pixel for point 8 in PWL.
4	31:24	**B4** Default Value: 96 Format: U8 The value of the bias for point 4 in PWL.
	23:16	**B3** Default Value: 76 Format: U8 The value of the bias for point 3 in PWL.
	15:8	**B2** Default Value: 56 Format: U8 The value of the bias for point 2 in PWL.
	7:0	**B1** Default Value: 36 Format: U8 The value of the bias for point 1 in PWL.
5	31:24	**B8** Default Value: 176 Format: U8 The value of the bias for point 8 in PWL.
	23:16	**B7** Default Value: 156 Format: U8 The value of the bias for point 7 in PWL.

COLOR_PROCESSING_STATE - ACE State		
	15:8	**B6** Default Value: 136 Format: U8 The value of the bias for point 6 in PWL.
	7:0	**B5** Default Value: 116 Format: U8 The value of the bias for point 5 in PWL.
6	31:16	**Reserved** Format: MBZ
	15:8	**B10** Default Value: 216 Format: U8 The value of the bias for point 10 in PWL.
	7:0	**B9** Default Value: 196 Format: U8 The value of the bias for point 9 in PWL.
7	31:27	**Reserved** Format: MBZ
	26:16	**S1** Format: U1.10 The value of the slope for point 1 in PWL. The default is 1024/1024.
	15:11	**Reserved** Format: MBZ
	10:0	**S0** Format: U1.10 The value of the slope for point 0 in PWL. The default is 1024/1024.
8	31:27	**Reserved** Format: MBZ

COLOR_PROCESSING_STATE - ACE State		
	26:16	**S3** Format: U1.10 The value of the slope for point 3 in PWL. The default is 1024/1024.
	15:11	**Reserved** Format: MBZ
	10:0	**S2** Format: U1.10 The value of the slope for point 2 in PWL. The default is 1024/1024.
9	31:27	**Reserved** Format: MBZ
	26:16	**S5** Format: U1.10 The value of the slope for point 5 in PWL. The default is 1024/1024.
	15:11	**Reserved** Format: MBZ
	10:0	**S4** Format: U1.10 The value of the slope for point 4 in PWL. The default is 1024/1024.
10	31:27	**Reserved** Format: MBZ
	26:16	**S7** Format: U1.10 The value of the slope for point 7 in PWL. The default is 1024/1024.
	15:11	**Reserved** Format: MBZ
	10:0	**S6** Format: U1.10 The value of the slope for point 6 in PWL. The default is 1024/1024.

COLOR_PROCESSING_STATE - ACE State		
11	31:27	**Reserved** Format: MBZ
	26:16	**S9** Format: U1.10 The value of the slope for point 9 in PWL. The default is 1024/1024.
	15:11	**Reserved** Format: MBZ
	10:0	**S8** Format: U1.10 The value of the slope for point 8 in PWL. The default is 1024/1024.
12	31:11	**Reserved** Format: MBZ
	10:0	**S10** Format: U1.10 The value of the slope for point 10 in PWL. The default is 1024/1024.

COLOR_PROCESSING_STATE - CSC State

COLOR_PROCESSING_STATE - CSC State

Source: BSpec

Size (in bits): 288

Default Value: 0x00002000, 0x00000000, 0x00000400, 0x00000000, 0x000004B4, 0x00000000, 0x00000000, 0x00000000, 0x00000000

This state structure contains the CSC state used by the color processing function.
It corresponds to DW55..DW63 of the Color Processing State.

DWord	Bit	Description
0	31:29	**Reserved** Format: MBZ
	28:16	**C1** Default Value: 0 Format: S2.10 2's complement Transform coefficient
	15:3	**C0** Default Value: 1024 Format: S2.10 2's complement Transform coefficient
	2	**YUV_IN** Default Value: 0 Format: YUV CSC input offset enable.
	1	**YUV_OUT** Default Value: 0 Format: RGB CSC output offset enable.
	0	**Transform Enable** Format: Enable
1	31:26	**Reserved** Format: MBZ

COLOR_PROCESSING_STATE - CSC State

	25:13	**C3** Default Value: 0 Format: S2.10 2's complement Transform coefficient.
	12:0	**C2** Default Value: 0 Format: S2.10 2's complement Transform coefficient.
2	31:26	**Reserved** Format: MBZ
	25:13	**C5** Default Value: 0 Format: S2.10 2's complement Transform coefficient.

COLOR_PROCESSING_STATE - PROCAMP State

COLOR_PROCESSING_STATE - PROCAMP State

Source: BSpec
Size (in bits): 64
Default Value: 0x00020001, 0x01000000

This state structure contains the PROCAMP state used by the color processing function.
It corresponds to DW53..DW54 of the Color Processing State.

DWord	Bit	Description
0	31:28	**Reserved** Format: MBZ
	27:17	**Contrast** Default Value: 1 Format: U4.7 Contrast magnitude.
	16:13	**Reserved** Format: MBZ
	12:1	**Brightness** Default Value: 0 Format: S7.4 2's complement Brightness magnitude.
	0	**PROCAMP Enable** Default Value: 1 Format: Enable
1	31:16	**Cos_c_s** Default Value: 256 Format: S7.8 2's complement UV multiplication cosine factor.
	15:0	**Sin_c_s** Default Value: 0 Format: S7.8 2's complement UV multiplication sine factor.

COLOR_PROCESSING_STATE - STD/STE State

COLOR_PROCESSING_STATE - STD/STE State

Source: BSpec

Size (in bits): 928

Default Value: 0x9A6E39F0, 0x400C0000, 0x00001180, 0xFE2F2E00, 0x000000FF, 0x00140000, 0xD82E0000, 0x8285ECEC, 0x00008282, 0x00000000, 0x02117000, 0xA38FEC96, 0x00008CC8, 0x00000000, 0x01478000, 0x0007C300, 0x00000000, 0x00000000, 0x1C180000, 0x00000000, 0x00000000, 0x00000000, 0x0007CF80, 0x00000000, 0x00000000, 0x1C080000, 0x00000000, 0x00000000, 0x00000000

This state structure contains the STD/STE state used by the color processing function.

DWord	Bit	Description
0	31:24	**V_Mid** Default Value: 154 Format: U8 Rectangle middle-point V coordinate
	23:16	**U_Mid** Default Value: 110 Format: U8 Rectangle middle-point U coordinate
	15:10	**Hue Max** Default Value: 14 Format: U6 Rectangle half width
	9:4	**Sat Max** Default Value: 31 Format: U6 Rectangle half length.
	3	**Reserved** Format: MBZ
	2	**Output Control** 0 – Output Pixels **[Default]** 1 – Output STD Decisions

COLOR_PROCESSING_STATE - STD/STE State

	1	**STE Enable** Format: Enable
	0	**STD Enable** Format: Enable
1	31	**Reserved** Format: MBZ
	30:28	**Diamond Margin** Default Value: 4 Format: U3
	27:21	**Diamond du** Default Value: 0 Format: S6 2's complement Rhombus center shift in the sat-direction, relative to the rectangle center.
	20:18	**HS Margin** Default Value: 3 Format: U3
	17:10	**Cos(α)** Format: S0.7 2's Compliment The default is 79/128
	9:8	**Reserved** Format: MBZ
	7:0	**Sin(α)** Format: S0.7 2's Compliment The default is 101/128
2	31:21	**Reserved** Format: MBZ
	20:13	**Diamond Alpha** Format: U2.6 1 / tan(β) The default is 100/64

COLOR_PROCESSING_STATE - STD/STE State

	12:7	**Diamond Th** Default Value: 35 Format: U6 Half length of the rhombus axis in the sat-direction.
	6:0	**Diamond dv** Default Value: 0 Format: S6 2's complement
3	31:24	**Y_point_3** Default Value: 254 Format: U8 Third point of the Y piecewise linear membership function.
	23:16	**Y_point_2** Default Value: 47 Format: U8 Second point of the Y piecewise linear membership function.
	15:8	**Y_point_1** Default Value: 46 Format: U8 First point of the Y piecewise linear membership function.
	7	**VY_STD_Enable** Format: Enable Enables STD in the VY subspace.
	6:0	**Reserved** Format: MBZ
4	31:18	**Reserved** Format: MBZ
	17:13	**Y_Slope_2** Format: U2.3 Slope between points Y3 and Y4. The default is 31/8.

COLOR_PROCESSING_STATE - STD/STE State

	12:8	**Y_Slope_1** Format: U2.3 Slope between points Y1 and Y2. The default is 31/8.
	7:0	**Y_point_4** Default Value: 255 Format: U8 Fourth point of the Y piecewise linear membership function
5	31:16	**INV_skin_types_margin** Format: U0.16 1/(2* Skin_types_margin) Value: 20 – Name: **[Default]** – Description: Skin_Type_margin
	15:0	**Inverse Margin VYL** Format: U0.16 1 / Margin_VYL The default is 3300/65536
6	31:24	**P1L** Default Value: 216 Format: U8 Y Point 1 of the lower part of the detection PWLF.
	23:16	**P0L** Default Value: 46 Format: U8 Y Point 0 of the lower part of the detection PWLF.
	15:0	**Inverse Margin VYU** Format: U0.16 1 / Margin_VYU The default is 1600/65536.
7	31:24	**B1L** Default Value: 130 Format: U8 V Bias 1 of the lower part of the detection PWLF.

COLOR_PROCESSING_STATE - STD/STE State

	23:16	**B0L** Default Value: 133 Format: U8 V Bias 0 of the lower part of the detection PWLF.
	15:8	**P3L** Default Value: 236 Format: U8 Y Point 3 of the lower part of the detection PWLF.
	7:0	**P2L** Default Value: 236 Format: U8 Y point 2 of the lower part of the detection PWLF.
8	31:27	**Reserved** Format: MBZ
	26:16	**S0L** Format: S2.8 2's complement Slope 0 of the lower part of the detection PWLF. The default is -5/256.
	15:8	**B3L** Default Value: 130 Format: U8 V Bias 3 of the lower part of the detection PWLF.
	7:0	**B2L** Default Value: 130 Format: U8 V Bias 2 of the lower part of the detection PWLF.
9	31:22	**Reserved** Format: MBZ
	21:11	**S2L** Format: S2.8 2's complement Slope 2 of the lower part of the detection PWLF. The default is 0/256.

COLOR_PROCESSING_STATE - STD/STE State		
	10:0	**S1L** Format: S2.8 2's complement Slope 1 of the lower part of the detection PWLF. The default is 0/256.
10	31:27	**Reserved** Format: MBZ
	26:19	**P1U** Default Value: 66 Format: U8 Y Point 1 of the upper part of the detection PWLF.
	18:11	**P0U** Default Value: 46 Format: U8 Y Point 0 of the upper part of the detection PWLF.
	10:0	**S3L** Format: S2.8 2's complement Slope 3 of the lower part of the detection PWLF. The default is 0/256.
11	31:24	**B1U** Default Value: 163 Format: U8 V Bias 1 of the upper part of the detection PWLF.
	23:16	**B0U** Default Value: 143 Format: U8 V Bias 0 of the upper part of the detection PWLF.
	15:8	**P3U** Default Value: 236 Format: U8 Y Point 3 of the upper part of the detection PWLF.

COLOR_PROCESSING_STATE - STD/STE State		
	7:0	**P2U** Default Value: 150 Format: U8 Y Point 2 of the upper part of the detection PWLF.
12	31:27	**Reserved** Format: MBZ
	26:16	**S0U** Format: S2.8 2's complement Slope 0 of the upper part of the detection PWLF. The default is 256/256.
	15:8	**B3U** Default Value: 140 Format: U8 V Bias 3 of the upper part of the detection PWLF.
	7:0	**B2U** Default Value: 200 Format: U8 V Bias 2 of the upper part of the detection PWLF.
13	31:22	**Reserved** Format: MBZ
	21:11	**S2U** Format: S2.8 2's complement Slope 2 of the upper part of the detection PWLF. The default is -179/256.
	10:0	**S1U** Format: S2.8 2's complement Slope 1 of the upper part of the detection PWLF. The default is -113/256.
14	31:28	**Reserved** Format: MBZ

COLOR_PROCESSING_STATE - STD/STE State

	27:20	**Skin Types Margin** Default Value: 20 Format: U8 Skin types Y margin.
	19:12	**Skin Types Thresh** Default Value: 120 Format: U8 Skin types Y threshold.
	11	**Skin Type Enable** Format: Enable Treat differently bright and dark skin types. 0 **[Default]** Disable
	10:0	**S3U** Format: S2.8 2's complement Slope 3 of the upper part of the detection PWLF. The default is 0/256.
15	31	**Reserved** Format: MBZ
	30:21	**SATB1** Format: S7.2 2's complement First bias for the saturation PWLF (bright skin). The default is -8/4.
	20:14	**SATP3** Default Value: 31 Format: S6 2's complement Third point for the saturation PWLF (bright skin).
	13:7	**SATP2** Default Value: 6 Format: S6 2's complement Second point for the saturation PWLF (bright skin).

COLOR_PROCESSING_STATE - STD/STE State

	6:0	**SATP1** Format: S6 2's complement First point for the saturation PWLF (bright skin). The default is -6.
16	31	**Reserved** Format: MBZ
	30:20	**SATS0** Format: U3.8 Zeroth slope for the saturation PWLF (bright skin). The default is 297/256.
	19:10	**SATB3** Format: S7.2 2's complement Third bias for the saturation PWLF (bright skin). The default is 124/4.
	9:0	**SATB2** Format: S7.2 2's complement Second bias for the saturation PWLF (bright skin). The default is 8/4.
17	31:22	**Reserved** Format: MBZ
	21:11	**SATS2** Format: U3.8 Second slope for the saturation PWLF (bright skin). The default is 297/256.
	10:0	**SATS1** Format: U3.8 First slope for the saturation PWLF (bright skin). The default is 85/256.
18	31:25	**HUEP3** Default Value: 14 Format: S6 2's complement Third point for the hue PWLF (bright skin)

COLOR_PROCESSING_STATE - STD/STE State

	24:18	**HUEP2** Default Value: 6 Format: S6 2's complement Second point for the hue PWLF (bright skin)
	17:11	**HUEP1** Format: S6 2's complement First point for the hue PWLF (bright skin). The default is -6.
	10:0	**SATS3** Format: U3.8 Thrid slope for the saturation PWLF (bright skin). The default is 256/256.
19	31:30	**Reserved** Format: MBZ
	29:20	**HUEB3** Format: S7.2 2's complement Third bias for the hue PWLF (bright skin). The default is 56/4.
	19:10	**HUEB2** Format: S7.2 2's complement Second bias for the hue PWLF (bright skin). The default is 8/4.
	9:0	**HUEB1** Format: S7.2 2's complement First bias for the hue PWLF (bright skin). The default is -8/4.
20	31:22	**Reserved** Format: MBZ
	21:11	**HUES1** Format: U3.8 First slope for the hue PWLF (bright skin) The default is 85/256.

COLOR_PROCESSING_STATE - STD/STE State

	10:0	**HUES0** Format: U3.8 Zeroth slope for the hue PWLF (bright skin) The default is 384/256.
21	31:22	**Reserved** Format: MBZ
	21:11	**HUES3** Format: U3.8 Third slope for the hue PWLF (bright skin) The default is 256/256.
	10:0	**HUES2** Format: U3.8 Second slope for the hue PWLF (bright skin) The default is 384/256.
22	31	**Reserved** Format: MBZ
	30:21	**SATB1_DARK** Format: S7.2 2's complement First bias for the saturation PWLF (dark skin) The default is 0/4.
	20:14	**SATP3_DARK** Default Value: 31 Format: S6 2's complement Third point for the saturation PWLF (dark skin)
	13:7	**SATP2_DARK** Default Value: 31 Format: S6 2's complement Second point for the saturation PWLF (dark skin)
	6:0	**SATP1_DARK** Format: S6 2's complement First point for the saturation PWLF (dark skin). The default is -11.

COLOR_PROCESSING_STATE - STD/STE State		
23	31	**Reserved** Format: MBZ
	30:20	**SATS0_DARK** Format: U3.8 Zeroth slope for the saturation PWLF (dark skin). The default is 397/256.
	19:10	**SATB3_DARK** Format: S7.2 2's complement Third bias for the saturation PWLF (dark skin). The default is 124/4.
	9:0	**SATB2_DARK** Format: S7.2 2's complement Second bias for the saturation PWLF (dark skin). The default is 124/4.
24	31:22	**Reserved** Format: MBZ
	21:11	**SATS2_DARK** Format: U3.8 Second slope for the saturation PWLF (dark skin). The default is 256/256.
	10:0	**SATS1_DARK** Format: U3.8 First slope for the saturation PWLF (dark skin). The default is 189/256.
25	31:25	**HUEP3_DARK** Default Value: 14 Format: S6 2's complement Third point for the hue PWLF (dark skin).
	24:18	**HUEP2_DARK** Default Value: 2 Format: S6 2's complement Third point for the hue PWLF (dark skin).

COLOR_PROCESSING_STATE - STD/STE State

	17:11	**HUEP1_DARK** Default Value: 0 Format: S6 2's complement Third point for the hue PWLF (dark skin).
	10:0	**SATS3_DARK** Format: U3.8 Third slope for the saturation PWLF (dark skin). The default is 256/256.
26	31:30	**Reserved** Format: MBZ
	29:20	**HUEB3_DARK** Format: S7.2 2's complement Third bias for the hue PWLF (dark skin). The default is 56/4.
	19:10	**HUEB2_DARK** Format: S7.2 2's complement Second bias for the hue PWLF (dark skin). The default is 0/4.
	9:0	**HUEB1_DARK** Format: S7.2 2's complement First bias for the hue PWLF (dark skin). The default is 0/4.
27	31:22	**Reserved** Format: MBZ
	21:11	**HUES1_DARK** Format: U3.8 First slope for the hue PWLF (dark skin). The default is 0/256.
	10:0	**HUES0_DARK** Format: U3.8 Zeroth slope for the hue PWLF (dark skin). The default is 256/256.

COLOR_PROCESSING_STATE - STD/STE State		
28	31:22	**Reserved** Format: MBZ
	21:11	**HUES3_DARK** Format: U3.8 Third slope for the hue PWLF (dark skin). The default is 256/256.
	10:0	**HUES2_DARK** Format: U3.8 Second slope for the hue PWLF (dark skin). The default is 299/256.

COLOR_PROCESSING_STATE - TCC State

COLOR_PROCESSING_STATE - TCC State

Source: BSpec

Size (in bits): 352

Default Value: 0xDCDCDC00, 0xDCDCDC00, 0x1E34CC91, 0x3E3CCE91, 0x02E80195, 0x0197046B, 0x01790174, 0x00096000, 0x00000000, 0x03030000, 0x009201C0

This state structure contains the TCC state used by the color processing function.
It corresponds to DW42..DW52 of the Color Processing State.

DWord	Bit	Description
0	31:24	**SatFactor3** Default Value: 220 Format: U1.7 The saturation factor for yellow.
	23:16	**SatFactor2** Default Value: 220 Format: U1.7 The saturation factor for red.
	15:8	**SatFactor1** Default Value: 220 Format: U1.7 The saturation factor for magenta.
	7	**TCC Enable** Format: Enable
	6:0	**Reserved** Format: MBZ
1	31:24	**SatFactor6** Default Value: 220 Format: U1.7 The saturation factor for blue.
	23:16	**SatFactor5** Default Value: 220 Format: U1.7 The saturation factor for cyan.

COLOR_PROCESSING_STATE - TCC State		
	15:8	**SatFactor4** Default Value: 220 Format: U1.7 The saturation factor for green.
	7:0	**Reserved** Format: MBZ
2	31:30	**Reserved** Format: MBZ
	29:20	**Base Color 3** Default Value: 483 Format: U10
	19:10	**Base Color 2** Default Value: 307 Format: U10
	9:0	**Base Color 1** Default Value: 145 Format: U10
3	31:30	**Reserved** Format: MBZ
	29:20	**Base Color 6** Default Value: 995 Format: U10
	19:10	**Base Color 5** Default Value: 819 Format: U10
	9:0	**Base Color 4** Default Value: 657 Format: U10
4	31:16	**Color Transit Slope 23** Default Value: 744 Format: U0.16 The calculation result of 1 / (BC3 - BC2) [1/62]

COLOR_PROCESSING_STATE - TCC State

	15:0	**Color Transit Slope 12** Default Value: 405 Format: U0.16 The calculation result of 1 / (BC2 - BC1) [1/57]
5	31:16	**Color Transit Slope 45** Default Value: 407 Format: U0.16 The calculation result of 1 / (BC5 - BC4) [1/57]
	15:0	**Color Transit Slope 34** Default Value: 1131 Format: U0.16 The calculation result of 1 / (BC4 - BC3) [1/61]
6	31:16	**Color Transit Slope 61** Default Value: 377 Format: U0.16 The calculation result of 1 / (BC1 - BC6) [1/62]
	15:0	**Color Transit Slope 56** Default Value: 372 Format: U0.16 The calculation result of 1 / (BC6 - BC5) [1/62]
7	31:22	**Color Bias 3** Default Value: 0 Format: U2.8 Color bias for BaseColor3.
	21:12	**Color Bias 2** Default Value: 150 Format: U2.8 Color bias for BaseColor2.
	11:2	**Color Bias 1** Default Value: 0 Format: U2.8 Color bias for BaseColor1.

COLOR_PROCESSING_STATE - TCC State

	1:0	**Reserved** Format: MBZ
8	31:22	**Color Bias 6** Default Value: 0 Format: U2.8 Color bias for BaseColor6.
	21:12	**Color Bias 5** Default Value: 0 Format: U2.8 Color bias for BaseColor5.
	11:2	**ColorBias4** Default Value: 0 Format: U2.8 Color bias for BaseColor4.
	1:0	**Reserved** Format: MBZ
9	31	**Reserved** Format: MBZ
	30:24	**UV Threshold** Default Value: 3 Format: U7 Low UV threshold.
	23:19	**Reserved** Format: MBZ
	18:16	**UV Threshold Bits** Default Value: 3 Format: U3 Low UV transition width bits.
	15:13	**Reserved** Format: MBZ

COLOR_PROCESSING_STATE - TCC State		
	12:8	**STE Threshold** Default Value: 0 Format: U5 Skin tone pixels enhancement threshold.
	7:3	**Reserved** Format: MBZ
	2:0	**STE Slope Bits** Default Value: 0 Format: U3 Skin tone pixels enhancement slope bits.
10	31:16	**Inverse UVMax Color** Default Value: 146 Format: U0.16 1 / UVMaxColor. Used for the SFs2 calculation.
	15:9	**Reserved** Format: MBZ
	8:0	**UVMax Color** Default Value: 448 Format: U9 The maximum absolute value of the legal UV pixels. Used for the SFs2 calculation.

Color Calculator State Pointer Message Header Control

MHC_RT_CCSP - Color Calculator State Pointer Message Header Control

Source:	BSpec
Size (in bits):	32
Default Value:	0x00000000

DWord	Bit	Description
0	31:6	**Color Calculator State Pointer** Format: GeneralStateOffset[31:6] Specifies the 64-byte aligned point to the color calculator state. This pointer is relative to the General State Base Address.
	5:0	**Reserved** Format: Ignore Ignored

Color Code Message Header Control

MHC_RT_CC - Color Code Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:10	**Reserved** Format: Ignore Ignored
	9:8	**Color Code** Format: U2 This ID is assigned by the Windower unit and is used to track synchronizing events. Reserved for HW implementation use
	7:0	**FFTID** Format: U8 This ID is assigned by the fixed function unit and is a unique identifier for the thread. It is used to free up resources used by the thread upon thread completion.

Context Descriptor Format

Context Descriptor Format

Source:	BSpec
Size (in bits):	64
Default Value:	0x00000000, 0x00000000

This is the format of context descriptors which make up submitted execlists.

DWord	Bit	Description

0..1	63:32	**Context ID**
		Description
		Context ID is a unique field assigned by GFX driver when a new context is created by which it is identified across all hierarchies of SW and HW.
		• Context ID is used for semaphore signaling by hardware and software.
		• Context ID matching is used by hardware to detect Lite Restore.
		• Context ID is used by hardware for page fault reporting and response with IOMMU.
		• Context switch reason and the associated Context ID are reported to Context Switch Status Buffer by hardware on a context switch.
		Context ID[31:0] (bits[63:32] of the context descriptor) are used for comparing during lite restore, semaphore signaling and context specific OA enabling.
		Context ID which is a 32 bit field is further divided in to three segments described below:
		• **Bits[63:55] (Bits 31:23 of Context ID)** is referred to as GroupID. GroupId+PASID combination of a context must be a unique identifier for contexts that are active in the system. The definition of active context is listed as:
		  • Any Context that is already submitted to h/w or already running in h/w.
		  • Any Context that hit page faults, was preempted (didn't run to context complete), and is waiting to be resubmitted pending IOMMU "last in group" response.
		  • Any Context that has experienced reset but not all faults are responded to.
		• **Bit[54] (Bit 22 of Context ID)** – MBZ for SW programming; this bit is used by hardware to distinguish between F&H vs F&S page requests and response messages to and from IOMMU. This bit is used by hardware on receiving page response to properly manage the page fault counters
		• **Bit[53] (Bit 21 of Context ID)** – MBZ from SW programming, is reserved for future hardware use.
		• **Bits[52:32] (Bits 20:0 of Context ID)** are for software use-only and must be unique field assigned by GFX driver when a new context is created.
		Context ID is reported by hardware to OABUFFER along with the performance statistics counters, Context ID is used for filtering the statistics on per context basis.

Context Descriptor Format

	31:12	**Logical Ring Context Address (LRCA)** Format: GraphicsAddress[31:12] This field contains the 4 KB-aligned address of the Logical Ring Context associated with this execlist element. LRCA must be always programmed in GGTT memory.
	11:9	**Reserved** Format: MBZ
	8	**Privilege Access** This field when set indicates PPGTT enabled in legacy context mode. In advanced context mode this field is reserved and must be zero.
	7:6	**Fault Handling** Source: CommandStreamer

Value	Name	Description
0h	Fault and Hang	Fault model is not supported and fault occurrence is treated as catastrophic. GAM indicates Fault Error to Command streamer. Fault Error interrupt is reported to scheduler. Command Streamer will not initiate context switch on occurrence of Fault Error.
1h	Fault and Halt	In this mode of operation faults are detected and corrected in the Page Walker. The client unit is stalled until the fault is corrected. The command streamer cannot preempt the context until the page fault condition is corrected and the access is completed. Restriction : When both coherent memory accesses are present in L3 memory fabric and OS-managed SVM is enabled, there are TLB invalidate deadlock conditions that require Fault-and-Stream fault mode instead of Fault-and-Halt.
2h	Fault and Stream	In this mode of operation faults are allowed on EU memory accesses. Page Walker will directly work with memory page handler to fix the faults on the fly for these surfaces. Command streamer is not aware of the fault service being done by page walker and goes with its normal execution rules for context switch. On completion of flush during context switch CS explicitly requests acknowledge message to Page Walker before proceeding further. Page Walker acknowledges Command Streamer once it is done on a clean boundary. Page Walker asserts Fault Error on occurrence of non recoverable fault or access violations (Command Streamer access, VFunit access, etc) to Command Streamer; this is the same as Fault and Hang behavior.
Others	Reserved	Reserved

Programming Notes
When execlist mode is set to "Legacy Context mode" Fault Handling mode must be set to "Fault and Hang."

Context Descriptor Format

		For proper programming for Page Fault modes, refer to memory interface section of the Bspec for the corresponding generation.
	5	**Reserved** Format: MBZ
	4:3	**Addressing Mode & Legacy Context** Format: U2 Legacy context set indicates GPU is operating in legacy context mode of operation and doesn't support any SVM features. Legacy context reset indicates GPU is operating in advanced context mode of operation and support SVM features. Based on the Context mode set Addressing mode is interpreted appropriately. The table below summarizes the combinations supported. GFX engine always uses 32b virtual addressing mode when translated using GGTT irrespective of below options.
	2	**Force Restore** Setting this bit will force a context restore operation when switching to this context even if the LRCA in the CCID register (normally the LRCA of the last context from the prior execlist) matches this one. Note that it is legal (and likely desirable) for the **Render Context Restore Inhibit** bit (part of the CTXT_SR_CTL register) in the context image being restored to also be set. The "ring" context is being forced to be restored from a newly initialized context despite a possible LRCA match. However, the render context for such a newly initialized context will likely be uninitialized and so should not be restored.

Value	Name	Description
00b	Advanced Context with no A/D support	GPU is enabled for advanced context mode and supports SVM features. GPU DOESN'T support Access and Dirty bit management in page tables. GPU supports 64b(48bit canonical) PPGTT graphics virtual addressing. PDP0_DESCRIPTOR contains the PASID (process address space identifier) and other PDP Descriptors are ignored.
01b	Legacy Context with no 64 bit VA support	GPU is enabled for legacy context mode of operation and DOESN'T support any SVM features. GPU supports 32b PPGTT graphics virtual addressing. PDP*_DESCRIPTOR contains the base address to 4GB of memory space supported.
10b	Advanced Context with A/D support	GPU is enabled for advanced context mode and supports SVM features. GPU DOES support Access and Dirty bit management in page tables. GPU supports 64b (48bit canonical) PPGTT graphics virtual addressing. PDP0_DESCRIPTOR contains the PASID (process address space identifier) and other PDP Descriptors are ignored.
11b	Legacy Context with 64 bit VA support	GPU is enabled for legacy context mode of operation and DOESN'T support any SVM features. GPU supports 64b (48bit canonical) PPGTT graphics virtual addressing and PDP0_DESCRIPTOR contains the base address to PML4 and other PDP Descriptors are ignored.

Context Descriptor Format		
	1	**Force PD Restore** Setting this bit will cause the on-chip page directory to be reloaded from the PD image in memory even on an LRCA match. No other operations of context restore will occur on an LRCA match, however. Software should set this bit if it has updated a context's page directory and wants the context to begin using the new page directory without having to switch away from it (to another context) and back again. Setting this bit will have no effect if **Force Restore** is also set; a complete context restore (including the PD) will be performed.
	0	**Valid** Set if this register holds a valid context descriptor. SW should set this bit in the Element registers that it has set up to contain valid context descriptors. Any execlist elements that are not used in a submitted execlist must have this bit clear.

Context Status

Context Status

Source: BSpec
Size (in bits): 64
Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0	63:32	**Context ID** Format: U32 The format of Context ID (sub-fields) described in "Context Descriptor Format".
	31:30	**Reserved** Format: MBZ
	29	**Reserved** Format: MBZ
	28	**Reserved**
	27:25	**Reserved** Format: MBZ
	24:20	**Reserved** Format: MBZ
	19:16	**Display Plane** This indicates the display plane for which Wait on Scanline/V-Blank/Sync Flip has been executed leading to context switch. This field is only valid when one of the "Wait on Scanline" or "Wait on Vblnak" or "Wait on sync Flip" is set.

Value	Name
0h	Reserved (Look at field 14:12)
1h	Reserved
2h	Reserved
3h	Display Plane-7
4h	Display Plane-8
5h	Display Plane-9
6h	Display Plane-10
7h	Display Plane-11
8h	Display Plane-12
[9h, Fh]	Reserved

Context Status

15 — Lite Restore

Format:	Enable

This bit is only valid only when Preempted bit is set.
When set, this bit indicates that a given context got preempted with the same context resulting in Lite Restore in HW.

14:12 — Display Plane Additional

This indicates the display plane for which Wait on Scanline/V-Blank/Sync Flip has been executed leading to context switch.
This field is only valid when one of the "Wait on Scanline" or "Wait on Vblnak" or "Wait on sync Flip" is set.
(Future - could remove the Sprites and move to bits 19:16)

Value	Name	Exists If
0h	Display Plane-1	[Wait on V-blank]==0
0h	Display Pipe-A	[Wait on V-blank]==1
1h	Display Plane-2	[Wait on V-blank]==0
1h	Display Pipe-B	[Wait on V-blank]==1
2h	Display Plane-3	[Wait on V-blank]==0

11 — Semaphore Wait Mode

Value	Name
0h	Signal Mode
1h	Poll Mode

10:9 — Reserved

Format:	MBZ

8 — Wait on Scanline

7 — Wait on Semaphore

6 — Wait on V-blank

5 — Wait on Sync Flip

4 — Context Complete
Element is completely processed (Head eqv to Tail) and resulted in a context switch.

3 — ACTIVE to IDLE
Following this context switch there is no active element available in HW to execute

Context Status		
	2	**Element Switch** Context Switch happened from first element in the current execlist to the second element of the same execlist
	1	**Preempted** Submission of a new execlist has resulted in context switch. The switch is from element in current execlist to element in pending execlist
	0	**IDLE to ACTIVE** Execlist submitted when HW is IDLE. When this bit is set rest of the fields in CSQ are not valid.

CSC COEFFICIENT FORMAT

CSC COEFFICIENT FORMAT

Source: BSpec
Size (in bits): 16
Default Value: 0x00000000

Coefficients for the CSC are stored in sign-exponent-mantissa format.
Two CSC coefficients are stored in each dword, the table below show the data packing in each dword.

DWord	Bit	Description
0	15	**Sign** Value: 0b — Name: Positive Value: 1b — Name: Negative
	14:12	**Exponent_bits** Represented as 2^(-n) Value: 110b — Name: 4 — Description: 4 or mantissa is bb.bbbbbbb Value: 111b — Name: 2 — Description: 2 or mantissa is b.bbbbbbbb Value: 000b — Name: 1 — Description: 1 or mantissa is 0.bbbbbbbbb Value: 001b — Name: 0.5 — Description: 0.5 or mantissa is 0.0bbbbbbbbb Value: 010b — Name: 0.25 — Description: 0.25 or mantissa is 0.00bbbbbbbbb Value: 011b — Name: 0.125 — Description: 0.125 or mantissa is 0.000bbbbbbbbb Value: Others — Name: Reserved — Description: Reserved
	11:3	**Mantissa**

Data Port 0 Message Types

MT_DP0 - Data Port 0 Message Types

Source: DataPort 0
Size (in bits): 5
Default Value: 0x00000000

Lists all the Message Types in a Data Port 0 Message Descriptor [18:14].
The Legacy messages are encoded in Data Port 0 with Bit 18 set to zero. The Message Header is optional for many (but not all) of these operations.
The Scratch Block messages are encoded in Data Port 0 with Bit 18 set to one. A Message Header is required.

DWord	Bit	Description
0	4	**Legacy DAP-DC Message** Format: Enumeration Legacy Message

Value	Name	Description
0h	No **[Default]**	Legacy DAP-DC Message
1h	Reserved	Scratch Block Message, descriptor uses different Message Type encoding

DWord	Bit	Description
0	3:0	**Message Type** Format: Enumeration Specifies type of message

Value	Name	Description
00h	MT0R_B **[Default]**	Block Read message
01h	MT0R_AB	Aligned Block Read message
02h	MT0R_OWDB	Oword Dual Block Read message
03h	MT0R_DWS	Dword Scattered Read message
04h	MT0R_BS	Byte Scattered Read message
07h	MT0_MEMFENCE	Memory Fence message
08h	MT0W_B	Block Write message
0Ah	MT0W_OWDB	Oword Dual Block Write message
0Bh	MT0W_DWS	Dword Scattered Write message
0Ch	MT0W_BS	Byte Scattered Write message
Others	Reserved	Ignored

Data Port 1 Message Types

MT_DP1 - Data Port 1 Message Types

Source: DataPort 1

Size (in bits): 5

Default Value: 0x00000000

Lists all the Message Types in a Data Port 1 Message Descriptor [18:14].
Most surface and atomic operations, both typed and untyped, are encoded on Data Port 1. The Message Header is optional for many (but not all) of these operations.
Most A64 Stateless operations are also encoded on Data Port 1. The Message Header is forbidden for all A64 messages on Data Port 1.

DWord	Bit	Description
0	4:0	**Message Type** Format: Enumeration Specifies type of message

Value	Name	Description
00h	MT1R_T **[Default]**	Transpose Read message
01h	MT1R_US	Untyped Surface Read message
02h	MT1A_UI	Untyped Atomic Integer Operation message
03h	MT1A_UI4x2	Untyped Atomic Integer Operation SIMD4x2 message
04h	MT1R_MB	Media Block Read message
05h	MT1R_TS	Typed Surface Read message
06h	MT1A_TA	Typed Atomic Integer Operation message
07h	MT1A_TA4x2	Typed Atomic Integer Operation SIMD4x2 message
08h	Reserved	Ignored
09h	MT1W_US	Untyped Surface Write mesage
0Ah	MT1W_MB	Media Block Write message
0Bh	MT1A_TC	Typed Atomic Counter Operation message
0Ch	MT1A_TC4x2	Typed Atomic Counter Operation SIMD4x2 message
0Dh	MT1W_TS	Typed Surface Write message
0Eh	Reserved	Ignored
10h	MT1R_A64_SB	A64 Scattered Read message
11h	MT1R_A64_US	A64 Untyped Surface Read message
12h	MT1A_A64_UI	A64 Untyped Atomic Integer Operation message
13h	MT1A_A64_UI4x2	A64 Untyped Atomic Integer Operation SIMD4x2 message
14h	MT1R_A64_B	A64 Block Read message
15h	MT1W_A64_B	A64 Block Write message

MT_DP1 - Data Port 1 Message Types

		18h	Reserved	Ignored
		19h	MT1W_A64_US	A64 Untyped Surface Write message
		1Ah	MT1W_A64_SB	A64 Scattered Write message
		1Bh	MT1A_UF	Untyped Atomic Float Operation message
		1Ch	MT1A_UF4x2	Untyped Atomic Float Operation SIMD4x2 message
		1Dh	MT1A_A64_UF	A64 Untyped Atomic Float Operation message
		1Eh	MT1A_A64_UF4x2	A64 Untyped Atomic Float Operation SIMD4x2 message
		Others	Reserved	Ignored

Data Port 2 Extended Message Descriptor

DP2_EXTDESC - Data Port 2 Extended Message Descriptor

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:16	**Sideband Offset** Format: U16 Specifies the 16-bit offset from the Sideband added to all the offsets in the Address Payload for DP2 messages.
	15:11	**Reserved** Format: MBZ Ignored
	10:0	**Execution Unit Extended Message Descriptor Definition** Format: Execution_Unit_Extended_Message_Descriptor EU uses this information as part of the SEND instruction.

Data Port 2 Message Types

MT_DP2 - Data Port 2 Message Types

Source: DataPort 2

Size (in bits): 5

Default Value: 0x00000002

Lists all the Message Types in a Data Port 2 Message Descriptor [18:14]. Scaled operations are on Data Port 2. They provide a pitch-scaled data address calculation for SLM Stateless address models. The Message Header is forbidden for SLM operations.

DWord	Bit	Description
0	4:1	**Message Type** Format: Enumeration Specifies type of message

Value	Name	Description
01h	MT2R_US **[Default]**	Untyped Surface Read message
02h	MT2R_A64_SB	A64 Scattered Read message
03h	MT2R_A64_US	A64 Untyped Surface Read message
04h	MT2R_BS	Byte Scattered Read message
09h	MT2W_US	Untyped Surface Write message
0Ah	MT2W_A64_US	A64 Untyped Surface Write message
0Bh	MT2W_A64_SB	A64 Scattered Write message
0Ch	MT2W_BS	Byte Scattered Write message
Others	Reserved	Ignored

	0	**Reserved** Format: MBZ Ignored

Data Port Bindless Surface Extended Message Descriptor

DP_EXTDESC_BTI252 - Data Port Bindless Surface Extended Message Descriptor

Source:	BSpec
Size (in bits):	32
Default Value:	0x00000000

DWord	Bit	Description
0	31:12	**Bindless Surface Offset** Format: BindlessSurfaceOffset[25:6] Specifies the bindless surface offset if the Binding Table Index is set to 252. Ignored otherwise. The bindless surface offset is added to the Bindless Surface Base Address as bits 25:6 of the byte-based address. The resulting address is the location of SURFACE_STATE for this message.
	11	**Reserved**
	10:0	**Execution Unit Extended Message Descriptor Definition** Format: Execution_Unit_Extended_Message_Descriptor EU uses this information as part of the SEND instruction.

Data Size Message Descriptor Control Field

MDC_DS - Data Size Message Descriptor Control Field

Source: BSpec
Size (in bits): 2
Default Value: 0x00000000

DWord	Bit	Description
0	1:0	**Data Size** Format: Enumeration Specifies the number of Bytes to be read or written

Value	Name	Description
00h	B	1 Byte
01h	W	2 Bytes
02h	DW	4 Bytes
03h	Reserved	Reserved

Deptrh Clear Value Format

STRUCTURE_TEMPLATE - Deptrh Clear Value Format

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:0	**Address1** Format: IEEE_FP Format: UNORM24 Format: UNORM16 When this field contains 24-bit UNORM, the upper 8-bits are reserved (0's) When this field contains 16-bit UNORM the upper 16-bits are reserved (0's)

Display Engine Render Response Message Definition

Display Engine Render Response Message Definition

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

The Display Engine Render Response Registers use bit definitions from this table.

Programming Notes

Some events can be sent to CS (Render Command Streamer) or BCS (Blitter Command Streamer). For render response messages sending flip done or scanline events, the destination, CS or BCS, is selected depending on the initiator of the flip or the load scanline command. For render response messages sending vertical blank events, the destinations, CS or BCS, or both CS and BCS,is selected depending on the DE_RR_DEST setting. Command Streamer Plane number to the Display Plane name mapping is available in the **Display Plane Capability and Interoperability section**.

The STEREO3D_EVENT_MASK selects between left eye and right eye reporting of vertical blank and scanline events in stereo 3D modes.

DWord	Bit	Description
0	31	**Reserved**
	30	**Reserved**
	29	**Reserved**
	28	**Reserved**
	27:23	**Reserved**
	22	**Reserved**
	21	**Pipe_C_Start_of_Vertical_Blank_Event** This event is reported on the start of the vertical blank of the transcoder attached to Pipe C.
	20	**Plane_2_C_Flip_Done_Event** This event is reported on the completion of a flip for Plane 2 C.
	19	**Reserved**
	18	**Plane_4_B_Flip_Done_Event** This event is reported on the completion of a flip for Plane 4 B. Not all projects have a plane 4 B.
	17	**Plane_4_A_Flip_Done_Event** This event is reported on the completion of a flip for Plane 4 A. Not all projects have a plane 4 A.
	16	**Plane_3_C_Flip_Done_Event** This event is reported on the completion of a flip for Plane 3 C.
	15	**Plane_1_C_Flip_Done_Event** This event is reported on the completion of a flip for Plane 1 C.

Display Engine Render Response Message Definition		
	14	**Pipe_C_Scanline_Event** This event is reported on the start of the selected scan line for the transcoder attached to Pipe C.
	13	**Reserved**
	12	**Reserved**
	11	**Pipe_B_Start_of_Vertical_Blank_Event** This event is reported on the start of the vertical blank of the transcoder attached to Pipe B.

	9	**Plane_1_B_Flip_Done_Event** This event is reported on the completion of a flip for Plane 1 B.
	8	**Pipe_B_Scanline_Event** This event is reported on the start of the selected scan line for the transcoder attached to Pipe B.
	7	**Plane_3_B_Flip_Done_Event** This event is reported on the completion of a flip for Plane 3 B.
	6	**Plane_3_A_Flip_Done_Event** This event is reported on the completion of a flip for Plane 3 A.
	5	**Reserved**
	4	**Reserved**
	3	**Pipe_A_Start_of_Vertical_Blank_Event** This event is reported on the start of the vertical blank of the transcoder attached to Pipe A.
	2	**Plane_2_A_Flip_Done_Event** This event is reported on the completion of a flip for Plane 2 A.
	1	**Plane_1_A_Flip_Done_Event** This event is reported on the completion of a flip for Plane 1 A.
	0	**Pipe_A_Scanline_Event** This event is reported on the start of the selected scan line for the transcoder attached to Pipe A.

DstRegNum

DstRegNum	
Source:	Eulsa
Size (in bits):	8
Default Value:	0x00000000

Description

Register Number
The register number for the operand. For a GRF register, is the part of a register address that aligns to a 256-bit (32-byte) boundary. For an ARF register, this field is encoded such that MSBs identify the architecture register type and LSBs provide the register number.
An ARF register can only be dst or src0. Any src1 or src2 operands cannot be ARF registers.
RegNum and SubRegNum together provide the byte-aligned address for the origin of a register region. RegNum provides bits 12:5 of that address. For one-source and two-source instructions, SubregNum provides bits 4:0. For three-source instructions, the address must be DWord-aligned; SubRegNum provides bits 4:2 of the address and bits 1:0 are zero.
This field is present for the direct addressing mode and not present for indirect addressing.
This field applies to both source and destination operands.

DWord	Bit	Description
0	7:0	**Destination Register Number**

Value	Name	Description
0-127	If {Dst/Src0/Src1/Src2}.RegFile==GRF	
0-0ffh	If {Dst/Src0/Src1/Src2}.RegFile==ARF	This field is used to encode the architecture register as well as providing the register number. See GEN Execution Environment chapter for details.

DstSubRegNum

DstSubRegNum

Source: Eulsa

Size (in bits): 5

Default Value: 0x00000000

Programming Notes

Note: The recommended instruction syntax uses subregister numbers within the GRF in units of actual data element size, corresponding to the data type used. For example for the F (Float) type, the assembler syntax uses subregister numbers 0 to 7, corresponding to subregister byte addresses of 0 to 28 in steps of 4, the element size.

DWord	Bit	Description
0	4:0	**Destination Sub Register Number** Value: 0-31, Name: If {Dst/Src0/Src1/Src2}.RegFile==GRF, Description: Value: 0-0ffh, Name: If {Dst/Src0/Src1/Src2}.RegFile==ARF, Description: This field is used to encode the architecture register as well as providing the register number. See GEN Execution Environment chapter for details.

Dword Data Payload Register

MDCR_DW - Dword Data Payload Register

Source: BSpec
Size (in bits): 256
Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0.0	31:0	**Dword0** Format: U32 Specifies the slot 0 data in this payload register
0.1	31:0	**Dword1** Format: U32 Specifies the slot 1 data in this payload register
0.2	31:0	**Dword2** Format: U32 Specifies the slot 2 data in this payload register
0.3	31:0	**Dword3** Format: U32 Specifies the slot 3 data in this payload register
0.4	31:0	**Dword4** Format: U32 Specifies the slot 4 data in this payload register
0.5	31:0	**Dword5** Format: U32 Specifies the slot 5 data in this payload register
0.6	31:0	**Dword6** Format: U32 Specifies the slot 6 data in this payload register
0.7	31:0	**Dword7** Format: U32 Specifies the slot 7 data in this payload register

Dword SIMD4x2 Atomic CMPWR Message Data Payload

MDP_AOP4X2_DW2 - Dword SIMD4x2 Atomic CMPWR Message Data Payload

Source:	BSpec
Size (in bits):	256
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**Src0 Slot0** Format: U32|S31|F32 Specifies the Slot 0 Source 0 data
1	31:0	**Src1 Slot0** Format: U32|S31|F32 Specifies the Slot 0 Source 1 data
2..3	63:0	**Reserved** Format: Ignore Ignored

DWord	**Bit**	**Description**
0.0-0.7	255:0	**Data[7:0]** Format: MDCR_DW Specifies the Slot [7:0] data

Dword SIMD16 Atomic Operation CMPWR Message Data Payload

MDP_AOP16_DW2 - Dword SIMD16 Atomic Operation CMPWR Message Data Payload

Source:	BSpec
Size (in bits):	1024
Default Value:	0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Src0[7:0]** Format: MDCR_DW Specifies the Source 0 data for Slot [7:0]
1.0-1.7	255:0	**Src0[15:8]** Format: MDCR_DW Specifies the Source 0 data for Slot [15:8]
2.0-2.7	255:0	**Src1[7:0]** Format: MDCR_DW Specifies the Source 1 data for Slot [7:0]
3.0-3.7	255:0	**Src1[15:8]** Format: MDCR_DW Specifies the Source 1 data for Slot [15:8]

Dword SIMD16 Data Payload

MDP_DW_SIMD16 - Dword SIMD16 Data Payload

Source:	BSpec
Size (in bits):	512
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Data[7:0]** Format: MDCR_DW Specifies the Slot [7:0] data
1.0-1.7	255:0	**Data[15:8]** Format: MDCR_DW Specifies the Slot [15:8] data

DX9_CONSTANTB_ENTRY

DX9_CONSTANTB_ENTRY		
Source:	RenderCS	
Size (in bits):	32	
Default Value:	0x00000000	
This structure is the payload of the 3DSTATE_DX9_CONSTANTB_* commands. Each entry provides the values for the one boolean constant being updated.		
DWord	**Bit**	**Description**
0	31:0	**Component** Format: U32 The boolean value to be stored.

DX9_CONSTANTF_ENTRY

DX9_CONSTANTF_ENTRY		
Source:	RenderCS	
Size (in bits):	128	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000	
This structure is the payload of the 3DSTATE_DX9_CONSTANTF_* commands. Each entry provides the values for the four components of one float constant being updated.		
DWord	**Bit**	**Description**
0	127:96	**Component 3** Format: IEEE_Float The 4th component of the nth float to be stored.
	95:64	**Component 2** Format: IEEE_Float The 3rd component of the nth float to be stored.
	63:32	**Component 1** Format: IEEE_Float The 2nd component of the nth float to be stored.
	31:0	**Component 0** Format: IEEE_Float The 1st component of the nth float to be stored.

DX9_CONSTANTI_ENTRY

DX9_CONSTANTI_ENTRY		
Source:	RenderCS	
Size (in bits):	128	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000	
This structure is the payload of the 3DSTATE_DX9_CONSTANTI_* commands. Each entry provides the values for the four components of one integer constant being updated.		
DWord	**Bit**	**Description**
0	31:0	**Component 0** Format: U32 The 1st component of the nth float to be stored.
1	31:0	**Component 1** Format: U32 The 2nd component of the nth float to be stored.
2	31:0	**Component 2** Format: U32 The 3rd component of the nth float to be stored.
3	31:0	**Component 3** Format: U32 The 4th component of the nth float to be stored.

Encoder Control State Parameters0

Encoder Control State Parameters0

Encoder Control State Parameters0

	16	**GOP-level indirect user-defined NAL data packet - enable** GOP-level user defined NAL packet is inserted during the first frame of a GOP if this field is enabled. **Value** / **Name** / **Description** 0 / Disable / Disable insertion of indirect NAL data packet 1 / Enable / Enable insertion of indirect NAL data packet **Programming Notes** Recommended value is 0. Header contains several NAL units. AVC spec needs AUD NAL to be the first NAL for a frame. If GOP header and Frame headers are enabled and both have AUD NAL it would lead to incorrect bit stream. Multiple NAL data packets can be programmed within the GOP-level indirect surface. A linked list data structure is allocated multiple elements (NAL packets) in contiguous memory. Each element consists of link descriptor fields and datum. The first four bytes of each element contain the link descriptor fields: Byte 0: length_in_bytes[7:0] -- LSB length of data element/NAL packet. Byte 1: length_in_bytes[15:8] -- MSB length of data element/NAL packet. Byte 2: <{7'b000_0000, last_NAL} -- Bit 0 indicates the current element is the last element of the link list. Byte 3: Reserved -- Reserved- MBZ Datum starts at Byte 4 of each element: Byte 4: NAL_START Byte 5: ... Byte N: NAL_END Case 1: last_NAL =1 all the bytes through ByteN would be sent to BSP. Case 2: last_NAL =0 and ByteN is CL alighned (N mod 64 =0). Next NAL descriptor starts at N 1 Byte. Case 3: last_NAL = 0 and ByteN is not CL aligned zero bytes stuffed till next NAL descriptor (63 – (N mod 64) bytes of zeros). Note: empty/zero datum is not allowed
	15:0	**Reserved**
2	31:17	**Reserved** Format: MBZ
	16	**Frame-level indirect user-defined NAL data packet - enable** Frame-level user defined NAL packet is inserted during the first frame of a frame if this field is enabled. **Value** / **Name** / **Description** 0 / Disable / Disable insertion of indirect NAL data packet 1 / Enable / Enable insertion of indirect NAL data packet **Programming Notes**

Encoder Control State Parameters0

		The recommended value is 1. As mentioned in GOP header enable, enabling GOP header and frame header causes problem. Enabling only frame header is safe and sufficient.
		Multiple NAL data packets can be programmed within the frame-level indirect surface. A linked list data structure is allocated multiple elements (NAL packets) in contiguous memory. Each element consists of link descriptor fields and datum. The first four bytes of each element contain the link descriptor fields: Byte 0: length_in_bytes[7:0] -- LSB length of data element/NAL packet. Byte 1: length_in_bytes[15:8] -- MSB length of data element/NAL packet. Byte 2: <{7'b000_0000, last_NAL} -- Bit 0 indicates the current element is the last element of the link list. Byte 3: Reserved -- Reserved- MBZ Datum starts at Byte 4 of each element: Byte 4: NAL_START Byte 5: ... Byte N: NAL_END Note: empty/zero datum is not allowed

3	31:0	**Reserved** Format: MBZ
4	31:0	**Reserved** Format: MBZ
5	31:16	**GOP size parameter** Number of (P-Frames + 1) per GOP structure.

Value	Name	Description
0		Infinite number of P-frames followed by an initial I-frame(IDR)
1		GOP structure will contain one IDR frame. HME and IME inter predictions are disabled.
2		One IDR + one P-frame per GOP
3-FFFFh		This parameter indicates the number of frames within the GOP structure. Each GOP will have one IDR frame follows by the value of the parameter minus one P-frames.

	15:4	**Reserved** Format: MBZ
	3:0	**log2 Maximum Frame Number Minus4** This field specifies the value of the variable MaxFrameNum that is used in Frame_Num count for every frame and must match the definition of log2_max_frame_num_minus field in SPS NAL packet.

Value	Name
0-12	

Encoder Control State Parameters0

		Programming Notes The same value should be set for log2_max_pic_order_cnt_lsb_minus4 field in SPS NAL packet.
6	31:0	**Reserved** Format: MBZ
7	31	**Transform 8x8 Flag** This field indicates that 8x8 transform can be used within the frame. **Value** / **Name** / **Description** 0 / 4x4 Integer Transform / The MB must be set to 4x4 transform. 1 / 8x8 Integer Transform / The MB could be coded with 8x8 transform. **Programming Notes** When this field is set to 1, The transform_size_8x8_flag syntax element, if present in the output bit stream, is the same as this field; However, whether transform_szie_8x8_flag is present or not in the output bit stream depends on several other conditions. Hardware set MB level transform8x8 flag to 1 for two conditions: • It might be 1 if IntraMbFlag = INTRA and IntraMbMode = INTRA_8x8 • It must be 1 if IntraMbFlag = INTER and there is no sub partition size less than 8x8 Otherwise, this field must be set to 0. For Intra MB if transform8x8 = 0, hardware will always honor it, thus intra8x8 will be the winner. If transform8x8 = 0, Intra16x16 prediction Enable or Intra4x4 prediction Enable MUST be true.
	30:29	**Reserved** Format: MBZ
	28:24	**Second Chroma QP Offset, Chroma_qp_offset [9:5]** Format: S4 **Range:** -12 to +12 According to AVC Spec. It specifies the offset for determining QP Cr from QP Y. It is set to the upper 5 bits of the value of the syntax element (Chroma_qp_offset[9:0]) read from the current active PPS. • Chroma_qp_offset [9:5] - second_chroma_qp_offset_bits **Programming Notes** To ensure that the MB size doesn't exceed 3200 bits, Cr/Cb QP cannot go below 10. The Value of MinQp for Luma and Chroma Offset is programmed in such a way to ensure this. E.g. If chroma offset = -5, MinQp should be >= 15. This would ensure that the Final Chroma QP >= (-5+15 = 10).
	23:21	**Reserved** Format: MBZ

Encoder Control State Parameters0

	20:16	**Chroma QP Offset, Chroma_qp_offset[4:0]** Format: S4 **Range:** -12 to +12 According to AVC Spec. It specifies the offset for determining QP Cb from QP Y.It is set to the lower 5 bits of the value of the syntax element (Chroma_qp_offset[9:0]) read from the current active PPS. • Chroma_qp_offset [4:0] - chroma_qp_offset_bits (from the current active PPS) **Programming Notes** To ensure that the MB size doesn't exceed 3200 bits, Cr/Cb QP cannot go below 10. The Value of MinQp for Luma and Chroma Offset is programmed in such a way to ensure this. E.g. If chroma offset = -5, MinQp should be >= 15. This would ensure that the Final Chroma QP >= (-5+15 = 10).
	15:8	**Reserved** Format: MBZ
	7	**Round Inter Enable** Format: Enable **Programming Notes** Recommended driver setting is 0. When rounding Inter is disabled, a value of 2/8 is used for rounding inter coefficients.
	6:4	**Rounding Inter (N)** Format: **RoundingPrecisionTable_3_Bits** **Programming Notes** Hardware default this field to 2 if "Round Inter Enable" is disable.
	3	**Round Intra Enable** Format: Enable **Programming Notes** Recommended driver setting is 0. When rounding Intra is disabled, a value of 4/8 is used for rounding intra coefficients.
	2:0	**Rounding Intra (N)** Format: **RoundingPrecisionTable_3_Bits** **Programming Notes** Hardware default this field to 4 if "Round Intra Enable" is disable.

Encoder Control State Parameters0

8	31:0	**Reserved** Format: MBZ
9	31:19	**Reserved** Format: MBZ
	18:16	**Slice Pattern Per MB Row** The field should be set according to the following table and the MB row size. In cases where row cannot be divided evenly, round up to the nearest MB to achieve the indicated number of slices per row. For purposes of this clause, the rate of macroblocks/second is the rate that applies to the video being transmitted, according to the definition in the AVC standard, That is: the macroblock rate = ceiling(frame width, 16)/16 * ceiling(frame height, 16)/16 * (frames/second). Slice size Must be larger than 4MB.

Macroblocks/second Rate	Slice Pattern
rate < 250,000	1 row = 1 slice
250,000 <= rate < 500,000	1 row = 2 equal slices
500,000 <= rate < 1,000,000	1 row = 4 equal slices
1,000,000 <= rate < 2,100,000	1 row = 8 equal slices
2,100,000 <= rate	1 row = 16 equal slices

Value	Name	Description
0		1 slice per MB row
1		2 slice per MB row
2		4 slice per MB row
3		8 slice per MB row
4		16 slice per MB row

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000

Description

The per block data is intended for use by the video encoder and consists of 16 bytes of Denoise block data and FMD variances.
Much of the data is encoded as an 8-bit mantissa with the leading 1 removed and a 4-bit shift.
To recover the original 17-bit integer this code can be used:
If (exp != 0)
Number = ((0x100 | Mantissa) « exp) » 7;
else
Number = mantissa;

The values for STAD, SHCM and SVCM for each 4x4 are shited down by 2 bits to make 14-bit values before being summed for the 16x4 block to make a 16-bit value. The result is then converted into the mantissa/exp format.

	63:48	**JIP** Format: S15 Jump Target Offset. The jump distance in number of eight-byte units if a jump is taken for the instruction.
	47	**Reserved** Format: MBZ
	46:44	**Src1.SrcType** Format: DataType This field specifies the numeric data type of the source operand src1. The bits of a source operand are interpreted as the identified numeric data type, rather than coerced into a type implied by the operator. Depending on RegFile field of the source operand, there are two different encoding for this field. If a source is a register operand, this field follows the Source Register Type Encoding. If a source is an immediate operand, this field follows the Source Immediate Type Encoding. **Programming Notes** Both source operands, src0 and src1, support immediate types, but only one immediate is allowed for a given instruction and it must be the last operand. Halfbyte integer vector (v) type can only be used in instructions in packed-word execution mode. Therefore, in a two-source instruction where src1 is of type :v, src0 must be of type :b, :ub, :w, or :uw.

EU_INSTRUCTION_COMPACT_TWO_SRC

EU_INSTRUCTION_COMPACT_TWO_SRC

Source:	EuIsa
Size (in bits):	64
Default Value:	0x00000000, 0x00000000

The following table describes the EU compact instruction format. The compact instruction format for 1 or 2-source instructions is essentially identical to the compact instruction format for earlier generations, but the compact fields expand to somewhat different fields in the native instruction format, as the native instruction format changed.

DWord	Bit	Description
0..1	63:56	**Src1.RegNum** Exists If: ([DataTypeIndex][Src1.RegFile]!='IMM') Format: **SrcRegNum** Maps to 108:101 (Src1.RegNum)
	63:56	**Src1.RegNum** Exists If: ([DataTypeIndex][Src1.RegFile]=='IMM') Maps to 103:96 (Imm32[7:0])
	55:48	**Src0.RegNum** Format: **SrcRegNum** Maps to 76:69 (Src0.RegNum)
	47:40	**Dst.RegNum** Format: **DstRegNum** Maps to 60:53 (Dst.RegNum)
	39:35	**Src1Index** Exists If: ([DataTypeIndex][Src1.RegFile]!='IMM') Format: **SrcIndex** If not an immediate operand, lookup one of 32 12-bit values that maps to bits 120:109. That value is used (from MSB to LSB) for the Src1.VertStride, various Src1 bit fields based on AccessMode (Src1.ChanSel[7:4], Src1.Width, Src1.HorzStride), Src1.AddrMode, and Src1.SrcMod bit fields Maps to 120:109

EU_INSTRUCTION_COMPACT_TWO_SRC

39:35 Src1Index

Exists If:	([DataTypeIndex][Src1.RegFile]=='IMM')

If an immediate operand, there is no lookup. Determines bits 127:104 (Imm32[31:8]) as follows: map bits 39:35 directly to bits 108:104. Sign extend to fill bits 127:109. Compact format bit 39 is thus copied to all of bits 127:108 for an immediate operand.

Maps to 127:104

34:30 Src0Index

Format:	SrcIndex

Lookup one of 32 12-bit values. That value is used (from MSB to LSB) for the Src0.VertStride, various Src0 bit fields based on AccessMode (Src0.ChanSel[7:4], Src0.Width, Src0.HorzStride), Src0.AddrMode, and Src0.SrcMod bit fields. Note that this field spans a DWord boundary within the QWord compacted instruction.

Maps to 88:77

29 Compaction Control

Format:	CmptCtrl

28 Reserved

Format:	MBZ

27:24 Reserved

Exists If:	(Property[Conditional Modifier]=='false')
Format:	MBZ

27:24 Conditional Modifier

Exists If:	(Property[Conditional Modifier]=='true')
Format:	CondModifier

23 Accumulator Write Control

Format:	AccWrCtrl

22:18 SubRegIndex

Lookup one of 32 15-bit values. That value is used (from MSB to LSB) for various fields for Src1, Src0, and Dst, including ChanEn/ChanSel, SubRegNum, and AddrImm[4] or AddrImm[4:0], depending on AddrMode and AccessMode.

Maps to 100:96, 68:64, 52:48

Value	Name	Description
0	000000000000000	0 | 0 | 0 |
1	000000000000001	0.x | 0.xx | 0.xx

EU_INSTRUCTION_COMPACT_TWO_SRC		
	7	**DebugCtrl** Format: DebugCtrl
	6:0	**Opcode**

EU_INSTRUCTION_CONTROLS_A

EU_INSTRUCTION_CONTROLS_A

Source: EuIsa
Size (in bits): 16
Default Value: 0x00000000

DWord	Bit	Description
0	15:13	**ExecSize** Format: **ExecSize** This field determines the number of channels operating in parallel for this instruction. The size cannot exceed the maximum number of channels allowed for the given data type.
	12	**PredInv** Exists If: (Property[Predication]=='true') This field, together with PredCtrl, enables and controls the generation of the predication mask for the instruction. When it is set, the predication uses the inverse of the predication bits generated according to setting of Predicate Control. In other words, effect of PredInv happens after PredCtrl. This field is ignored by hardware if Predicate Control is set to 0000 - there is no predication. PMask is the final predication mask produced by the effects of both fields.
		Value / **Name** / **Description** 0 / Positive **[Default]** / Positive polarity of predication. Use the predication mask produced by PredCtrl 1 / Negative / Negative polarity of predication. If PredCtrl is nonzero, invert the predication mask.
	12	**Reserved** Exists If: (Property[Predication]=='false')
	11:8	**PredCtrl** Exists If: (Property[Predication]=='true') Format: **PredCtrl** This field, together with PredInv, enables and controls the generation of the predication mask for the instruction. It allows per-channel conditional execution of the instruction based on the content of the selected flag register. Encoding depends on the access mode. In Align16 access mode, there are eight encodings (including no predication). All encodings are based on group-of-4 predicate bits, including channel sequential, replication swizzles and horizontal any|all operations. The same configuration is repeated for each group-of-4 execution channels.
	11:8	**Reserved** Exists If: (Property[Predication]=='false') Format: **PredCtrl**

EU_INSTRUCTION_CONTROLS_A

	7:6	**Thread Control** Format: **ThreadCtrl** Thread Control. This field provides explicit control for thread switching. If this field is set to 00b, it is up to the GEN execution units to manage thread switching. This is the normal (and unnamed) mode. In this mode, for example, if the current instruction cannot proceed due to operand dependencies, the EU switches to the next available thread to fill the compute pipe. In another example, if the current instruction is ready to go, however, there is another thread with higher priority that also has an instruction ready, the EU switches to that thread. If this field is set to Switch, a forced thread switch occurs after the current instruction is executed and before the next instruction. In addition, a long delay (longer than the execution pipe latency) is introduced for the current thread. Particularly, the instruction queue of the current thread is flushed after the current instruction is dispatched for execution. Switch is designed primarily as a safety feature in case there are race conditions for certain instructions.
	5:4	**QtrCtrl** Format: **QtrCtrl** **Quarter Control.** This field provides explicit control for ARF selection. This field combined with NibCtrl and ExecSize determines which channels are used for the ARF registers.
	3	**NibCtrl** Nibble Control. This field is used in some instructions along with QtrCtrl. See the description of QtrCtrl below. NibCtrl is only used for SIMD4 instructions with a DF (Double Float) source or destination.

Value	Name	Description
0	Odd	Use an odd 1/8th for DMask/VMask and ARF (first, third, fifth, or seventh depending on QtrCtrl).
1	Even	Use an even 1/8th for DMask/VMask and ARF (second, fourth, sixth, or eighth depending on QtrCtrl).

Programming Notes
Note that if eighths are given zero-based indices from 0 to 7, then NibCtrl = 0 indicates even indices and NibCtrl = 1 indicates odd indices.

EU_INSTRUCTION_CONTROLS_A

	2:1	**DepCtrl** Format: DepCtrl Destination Dependency Control. This field selectively disables destination dependency check and clear for this instruction. When it is set to 00, normal destination dependency control is performed for the instruction - hardware checks for destination hazards to ensure data integrity. Specifically, destination register dependency check is conducted before the instruction is made ready for execution. After the instruction is executed, the destination register scoreboard will be cleared when the destination operands retire. When bit 10 is set (NoDDClr), the destination register scoreboard will NOT be cleared when the destination operands retire. When bit 11 is set (NoDDChk), hardware does not check for destination register dependency before the instruction is made ready for execution. NoDDClr and NoDDChk are not mutual exclusive. When this field is not all-zero, hardware does not protect against destination hazards for the instruction. This is typically used to assemble data in a fine grained fashion (e.g. matrix-vector compute with dot-product instructions), where the data integrity is guaranteed by software based on the intended usage of instruction sequences.
	0	**AccessMode** Access Mode. This field determines the operand access for the instruction. It applies to all source and destination operands. When it is cleared (Align1), the instruction uses byte-aligned addressing for source and destination operands. Source swizzle control and destination mask control are not supported. When it is set (Align16), the instruction uses 16-byte-aligned addressing for all source and destination operands. Source swizzle control and destination mask control are supported in this mode.

Value	Name
0	Align1 **[Default]**
1	Align16

EU_INSTRUCTION_CONTROLS_B

EU_INSTRUCTION_CONTROLS_B

Source: Eulsa
Size (in bits): 4
Default Value: 0x00000000

DWord	Bit	Description
0	3	**Saturate** Exists If: (Property[Saturation]=='true') Enables or disables destination saturation. When it is set, output values to the destination register are saturated. The saturation operation depends on the destination data type. Saturation is the operation that converts any value outside the saturation target range for the data type to the closest value in the target range. For a floating-point destination type, the saturation target range is [0.0, 1.0]. For a floating-point NaN, there is no *closest value*; any NaN saturates to 0.0. Note that enabling Saturate overrides all of the NaN propagation behaviors described for various numeric instructions. Any floating-point number greater than 1.0, including +INF, saturates to 1.0. Any negative floating-point number, including -INF, saturates to 0.0. Any floating-point number in the range 0.0 to 1.0 is not changed by saturation. For an integer destination type, the maximum range for that type is the saturation target range. For example, the saturation range for B (Signed Byte Integer) is [-128, 127]. When Saturate is clear, destination values are not saturated. For example, a wrapped result (modulo) is output to the destination for an overflowed integer value. See the Numeric Data Typessection for information about data types and their ranges. Value / Name / Description 0 / No destination modification **[Default]** / 1 / sat / Saturate the output
	3	**Reserved** Exists If: (Property[Saturation]=='false') Format: MBZ
	2	**DebugCtrl** This field allows the insertion of a breakpoint at the current instruction. When the bit is set, hardware automatically stores the current IP in CR register and jumps to the System IP (SIP) BEFORE executing the current instruction. Value / Name 0 / No Breakpoint **[Default]** 1 / Breakpoint

EU_INSTRUCTION_CONTROLS_B

	1	**CmptCtrl** Compaction Control Indicates whether the instruction is compacted to the 64-bit compact instruction format. When this bit is set, the 64-bit compact instruction format is used. The EU decodes the compact format using lookup tables internal to the hardware, but documented for use by software tools. Only some instruction variations can be compacted, the variations supported by those lookup tables and the compact format. See EU Compact Instruction Format for more information.

Value	Name	Description
0	NoCompaction	No compaction. 128-bit native instruction supporting all instruction options.
1	Compacted	Compaction is enabled. 64-bit compact instruction supporting only some instruction variations.

	0	**AccWrCtrl** AccWrCtrl. This field allows per instruction accumulator write control.

Value	Name	Description
0	Don't write to ACC **[Default]**	
1	Update ACC	Write result to the ACC, and destination

Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0..3	127:31	**Reserved** Format: MBZ
	30	**DebugCtrl** This field allows the insertion of a breakpoint at the current instruction. When the bit is set, hardware automatically stores the current IP in CR register and jumps to the System IP (SIP) BEFORE executing the current instruction. **Value** / **Name** 0 — No Breakpoint **[Default]** 1 — Breakpoint
	29:7	**Reserved** Format: MBZ
	6:0	**Opcode** Format: EU_OPCODE

EU_INSTRUCTION_OPERAND_CONTROLS

EU_INSTRUCTION_OPERAND_CONTROLS

Source: Eulsa
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:16	**Destination Register Region** Exists If: (Structure[EU_INSTRUCTION_CONTROLS_A][AccessMode]=='Align16') Format: **EU_INSTRUCTION_OPERAND_DST_ALIGN16**
	31:16	**Destination Register Region** Exists If: (Structure[EU_INSTRUCTION_CONTROLS_A][AccessMode]=='Align1') Format: **EU_INSTRUCTION_OPERAND_DST_ALIGN1**
	15	**Reserved** Exists If: ([Destination Register Region][Destination Addressing Mode]=='Direct') Format: MBZ
	15	**Destination Address Immediate[9:9]** Exists If: ([Destination Register Region][Destination Addressing Mode]=='Indirect') Format: U1
	14:11	**Src0.SrcType** Exists If: ([Src0.RegFile]!='IMM') Format: **SrcType**
	14:11	**Src0.SrcType** Exists If: ([Src0.RegFile]=='IMM') Format: **SrcImmType**
	10:9	**Src0.RegFile** Format: **RegFile**
	8:5	**Destination Data Type** Format: **DstType** This field specifies the numeric data type of the destination operand dst. The bits of the destination operand are interpreted as the identified numeric data type, rather than coerced into a type implied by the operator. For a send instruction, this field applies to the CurrDst - the current destination operand.
	4:3	**Destination Register File** Format: **RegFile**

EU_INSTRUCTION_OPERAND_CONTROLS

	2	**MaskCtrl** Mask Control (formerly Write Enable Control). This field determines if the the per channel write enables are used to generate the final write enable. This field should be normally "0". **Value** / **Name** / **Description** 0 / Normal **[Default]** / 1 / Write all channels / Except channels killed with predication control **Programming Notes** MaskCtrl = NoMask skips the check for PcIP[n] == ExIP before enabling a channel, as described in the Evaluate Write Enable section.
	1:0	**Flag Register Number/Subregister Number**

EU_INSTRUCTION_OPERAND_DST_ALIGN1

EU_INSTRUCTION_OPERAND_DST_ALIGN1

Source: Eulsa
Size (in bits): 16
Default Value: 0x00000000

DWord	Bit	Description
0	15	**Destination Addressing Mode** Format: **AddrMode** For a send instruction, this field applies to PostDst - the post destination operand. Addressing mode for CurrDst (current destination operand) is fixed as Direct. (See Instruction Reference chapter for CurrDst and PostDst.)
	14:13	**Destination Horizontal Stride** Format: **HorzStride** For a send instruction, this field applies to CurrDst. PostDst only uses the register number.
	12:9	**Destination Address Subregister Number** Exists If: ([Destination Addressing Mode]=='Indirect') Format: **AddrSubRegNum** For a send instruction, this field applies to PostDst
	12:5	**Destination Register Number** Exists If: ([Destination Addressing Mode]=='Direct') Format: **DstRegNum** For a send instruction, this field applies to PostDst.
	8:0	**Destination Address Immediate** Exists If: ([Destination Addressing Mode]=='Indirect') Format: S8 For a send instruction, this field applies to PostDst.
	4:0	**Destination Subregister Number** Exists If: ([Destination Addressing Mode]=='Direct') Format: **DstSubRegNum** For a send instruction, this field applies to CurrDst.

DWord	**Bit**	**Description**
0	15	**Destination Addressing Mode** Format: **AddrMode** For a send instruction, this field applies to PostDst - the post destination operand. Addressing mode for CurrDst (current destination operand) is fixed as Direct. (See Instruction Reference chapter for CurrDst and PostDst.)
	14:13	**Reserved** Format: MBZ
	12:9	**Destination Address Subregister Number** Exists If: ([Destination Addressing Mode]=='Indirect') Format: **AddrSubRegNum** For a send instruction, this field applies to PostDst
	12:5	**Destination Register Number** Exists If: ([Destination Addressing Mode]=='Direct') Format: **DstRegNum** For a send instruction, this field applies to PostDst.
	8:4	**Destination Address Immediate[8:4]** Exists If: ([Destination Addressing Mode]=='Indirect') Format: S8[8:4] For a send instruction, this field applies to PostDst
	4	**Destination Subregister Number** Exists If: ([Destination Addressing Mode]=='Direct') Format: **DstSubRegNum[4:4]** For a send instruction, this field applies to CurrDst.
	3:0	**Destination Channel Enable** Format: **ChanEn[4]** For a send instruction, this field applies to the CurrDst

EU_INSTRUCTION_OPERAND_SEND_MSG

EU_INSTRUCTION_OPERAND_SEND_MSG

Source: EuIsa
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31	**EOT** **Description** This field controls the termination of the thread. For a send instruction, if this field is set, EU will terminate the thread and also set the EOT bit in the message sideband. This field only applies to the send instruction. It is not present for other instructions. **Value** / **Name** 0 — Thread is not terminated 1 — EOT
	30:0	**Message Descriptor** Exists If: [SelReg32Desc]=='IMM' Format: **MsgDescpt31**
	30:0	**Reg32** Exists If: [SelReg32Desc]!='IMM' In a send or sendc instruction refers to the option of providing the message descriptor field DWord, of which bits 30:0 are used, in the first two words of the Address Register rather than as an immediate operand.

EU_INSTRUCTION_SOURCES_REG_REG

30:27 **Src1.SrcType**

Format:	SrcType

This field specifies the numeric data type of the source operand src1. The bits of a source operand are interpreted as the identified numeric data type, rather than coerced into a type implied by the operator. Depending on RegFile field of the source operand, there are two different encoding for this field. If a source is a register operand, this field follows the Source Register Type Encoding. If a source is an immediate operand, this field follows the Source Immediate Type Encoding.

Value	Name
11b	Reserved

Programming Notes
Both source operands, src0 and src1, support immediate types, but only one immediate is allowed for a given instruction and it must be the last operand.
Halfbyte integer vector (v) type can only be used in instructions in packed-word execution mode. Therefore, in a two-source instruction where src1 is of type :v, src0 must be of type :b, :ub, :w, or :uw.

26:25 **Src1.RegFile**

Format:	RegFile

24:0 **Source 0**

Exists If:	(Structure[EU_INSTRUCTION_CONTROLS_A][AccessMode]=='Align16') AND (Structure[EU_INSTRUCTION_OPERAND_CONTROLS][Src0.RegFile]!='IMM')
Format:	EU_INSTRUCTION_OPERAND_SRC_REG_ALIGN16

24:0 **Source 0**

Exists If:	(Structure[EU_INSTRUCTION_CONTROLS_A][AccessMode]=='Align1') AND (Structure[EU_INSTRUCTION_OPERAND_CONTROLS][Src0.RegFile]!='IMM')
Format:	EU_INSTRUCTION_OPERAND_SRC_REG_ALIGN1

Execution_Unit_Extended_Message_Descriptor

FunctionControl

FunctionControl		
Source:	Eulsa	
Size (in bits):	6	
Default Value:	0x00000000	

DWord	Bit	Description
0	5:4	**Reserved**
	3:0	**Target Function ID**

Value	Name
0000b	Reserved
0001b	INV (Reciprocal)
0010b	LOG
0011b	EXP
0100b	SQRT
0101b	RSQ
0110b	SIN
0111b	COS
1000b	Reserved
1001b	FDIV
1010b	POW
1011b	INT DIV Quotient and remainder
1100b	INT DIV Quotient only
1101b	INT DIV Remainder only
1110b	INVM
1111b	RSQRTM

GATHER_CONSTANT_ENTRY

GATHER_CONSTANT_ENTRY		
Source:	RenderCS	
Size (in bits):	16	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	15:8	**Constant Buffer Offset** Format: Offset[7:0]ConstantBuffer This field specifies the Offset in 128-bit units of the 128b entry fetched from the constant buffer for this entry (including when **On-Die Table Read Enable** is set).
	7:4	**Channel Mask** Mask: Mask[3:0] Format: ConstantBuffer Each bit of this field correspond to the 4 channels of each entry fetched from memory. When the bit is a 1, the corresponding 32-bit value is loaded in FF's push constant buffer. When the bit is a 0, the corresponding 32-bit value is not loaded. If this field is zero it means the entry is not used.
	3:0	**Binding Table Index Offset** Format: Constant Buffer Index offset [3:0]Surface State for ConstantBuffer This field specifies the Binding Table index offset from the **Constant Buffer Binding Table Block** starting point in the Binding Table. This value is added to the **Constant Buffer Binding Table Block** will result in the Binding Table Index pointing to the surface state containing the constant buffer to be referenced. If **VS Constant Buffer Dx9 Enable** is set then a value of '1' specifies that the fetch to the constant buffer should be offset by 4KB in order to address the upper 4K of the constant buffer. Any value greater than '1' is invalid when **VS Constant Buffer Dx9 Enable** is set.

GraphicsAddress63-0

GA63-0 - GraphicsAddress63-0		
Source:	BSpec	
Size (in bits):	64	
Default Value:	0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0..1 GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. For the specified product generations, use 48-bit addressing.	63:48	**Reserved** Format: MBZ
	47:0	**GraphicsAddress47-0** Format: GraphicsAddress[47:0]

GraphicsAddress63-1

GA63-1 - GraphicsAddress63-1

Source:	BSpec
Size (in bits):	63
Default Value:	0x00000000, 0x00000000

This structure is intended to define the upper bits of the GraphicsAddress, when bit 0 is already defined in the referring register. So bit 0 of this structure should correspond to bit 1 of the full GraphicsAddress.

DWord	Bit	Description
0..1 GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address.	62:47	**Reserved** Format: MBZ
	46:0	**GraphicsAddress47-1** Format: GraphicsAddress[47:1] Bits 47:1 of a 48-bit GraphicsAddress. Look for bit 0 definition in the referring register.

GraphicsAddress63-2

GA63-2 - GraphicsAddress63-2

Source:	BSpec
Size (in bits):	62
Default Value:	0x00000000, 0x00000000

This structure is intended to define the upper bits of the GraphicsAddress, when bits 1:0 are already defined in the referring register. So bit 0 of this structure should correspond to bit 2 of the full GraphicsAddress.

DWord	Bit	Description
0..1 GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address.	61:46	**Reserved** Format: MBZ
	45:0	**GraphicsAddress47-2** Format: GraphicsAddress[47:2] Bits 47:2 of a 48-bit GraphicsAddress. Look for the definition of bits 1:0 in the referring register.

GraphicsAddress63-3

GA63-3 - GraphicsAddress63-3		
Source:	BSpec	
Size (in bits):	61	
Default Value:	0x00000000, 0x00000000	
This structure is intended to define the upper bits of the GraphicsAddress, when bits 2:0 are already defined in the referring register. So bit 0 of this structure should correspond to bit 3 of the full GraphicsAddress.		
DWord	**Bit**	**Description**
0..1 GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address.	60:45	**Reserved** Format: MBZ
	44:0	**GraphicsAddress47-3** Format: GraphicsAddress[47:3] Bits 47:2 of a 48-bit GraphicsAddress. Look for the definition of bits 2:0 in the referring register.

GraphicsAddress63-4

GA63-4 - GraphicsAddress63-4

Source:	BSpec
Size (in bits):	60
Default Value:	0x00000000, 0x00000000

This structure is intended to define the upper bits of the GraphicsAddress, when bits 3:0 are already defined in the referring register. So bit 0 of this structure should correspond to bit 4 of the full GraphicsAddress.

DWord	Bit	Description
0..1 GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address.	59:44	**Reserved** Format: MBZ
	43:0	**GraphicsAddress47-4** Format: GraphicsAddress[47:4] Bits 47:4 of a 48-bit GraphicsAddress. Look for the definition of bits 3:0 in the referring register.

GraphicsAddress63-5

GA63-5 - GraphicsAddress63-5		
Source:	BSpec	
Size (in bits):	59	
Default Value:	0x00000000, 0x00000000	
This structure is intended to define the upper bits of the GraphicsAddress, when bits 4:0 are already defined in the referring register. So bit 0 of this structure should correspond to bit 5 of the full GraphicsAddress.		
DWord	**Bit**	**Description**
0..1 GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address.	58:43	**Reserved** Format: MBZ
	42:0	**GraphicsAddress47-5** Format: GraphicsAddress[47:5] Bits 47:5 of a 48-bit GraphicsAddress. Look for the definition of bits 4:0 in the referring register.

GraphicsAddress63-6

GA63-6 - GraphicsAddress63-6

Source:	BSpec
Size (in bits):	58
Default Value:	0x00000000, 0x00000000

This structure is intended to define the upper bits of the GraphicsAddress, when bits 5:0 are already defined in the referring register. So bit 0 of this structure should correspond to bit 6 of the full GraphicsAddress.

DWord	Bit	Description
0..1 GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address.	57:42	**Reserved** Format: MBZ
	41:0	**GraphicsAddress47-6** Format: GraphicsAddress[47:6] Bits 47:6 of a 48-bit GraphicsAddress. Look for the definition of bits 5:0 in the referring register.

GraphicsAddress63-12

GA63-12 - GraphicsAddress63-12		
Source:	BSpec	
Size (in bits):	52	
Default Value:	0x00000000, 0x00000000	
This structure is intended to define the upper bits of the GraphicsAddress, when bits 11:0 are already defined in the referring register. So bit 0 of this structure should correspond to bit 12 of the full GraphicsAddress.		
DWord	**Bit**	**Description**
0..1 GraphicsAddress is a 64-bit value [63:0], but only a portion of it is used by hardware. The upper reserved bits are ignored and must be zero. Some GraphicsAddress fields only specify the upper address bits. For example GraphicsAddress[47:12] would be a 4KB page address.	51:36	**Reserved** Format: MBZ
	35:0	**GraphicsAddress47-12** Format: GraphicsAddress[47:12] Bits 47:12 of a 48-bit GraphicsAddress. Look for the definition of bits 11:0 in the referring register.

GTC Interrupt Bit Definition

GTC Interrupt Bit Definition		
Source:	BSpec	
Size (in bits):	32	
Default Value:	0x00000000	
The GTC Interrupt Registers all share the same bit definitions from this table.		
DWord	**Bit**	**Description**
0	31:26	**Reserved** Format: MBZ
	25	**GTC Lock Loss** GTC has lost lock with a remote GTC sink. The difference between the local and remote GTC has exceeded programmed threshold.
	24	**GTC Aux Rx Error portA** An aux channel error occurred during GTC transfer with remote GTC sink attached to this port.
	23	**GTC Update Complete portA** A hardware initiated GTC update has completed with a sink attached to this port.
	22	**Reserved** Format: MBZ
	21:20	**Reserved**
	19:18	**Reserved**
	17	**GTC Aux Rx Error portD** An aux channel error occured during GTC transfer with remote GTC sink attached to this port.
	16	**GTC Update Complete portD** A hardware initiated GTC update has completed with a sink attached to this port.
	15:10	**Reserved** Format: MBZ
	9	**GTC Aux Rx Error portC** An aux channel error occurred during GTC transfer with remote GTC sink attached to this port.
	8	**GTC Update Complete portC** A hardware initiated GTC update has completed with a sink attached to this port.
	7:2	**Reserved** Format: MBZ
	1	**GTC Aux Rx Error portB** An aux channel error occurred during GTC transfer with remote GTC sink attached to this port.
	0	**GTC Update Complete portB** A hardware initiated GTC update has completed with a sink attached to this port.

Half Precision Dual Source SIMD8 Message Data Payload Register

MDPR_DSH_SIMD8 - Half Precision Dual Source SIMD8 Message Data Payload Register

Source:	BSpec
Size (in bits):	256
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

Hardware-Detected Error Bit Definitions

Hardware-Detected Error Bit Definitions

Source: RenderCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:8	**Reserved** Format: MBZ
	7	**Reserved**
	6:3	**Reserved**
	2	**Command Privilege Violation Error** This bit is set if a command classified as privileged is parsed in a non-privileged batch buffer. The command will be converted to a NOOP and parsing will continue.
	1	**Reserved** Format: MBZ
	0	**Instruction Error** This bit is set when the Renderer Instruction Parser detects an error while parsing an instruction. Instruction errors include: • Client ID value (Bits 31:29 of the Header) is not supported (only MI, 2D and 3D are supported). • Defeatured MI Instruction Opcodes: **Value** / **Name** / **Description** 1 / / Instruction Error detected **Programming Notes** This error indications cannot be cleared except by reset (i.e., it is a fatal error).

DWord	Bit	Description
0	31:0	**Interrupt Status Register Storage** The content of the ISR register is written to this location whenever an "unmasked" bit of the ISR (as determined by the HWSTAM register) changes state.

Hardware Status Page Layout		
1..3	31:0	**Reserved** Must not be used.

HCP_PAK_INSERT_OBJECT_INDIRECT_PAYLOAD

HCP_PAK_INSERT_OBJECT_INDIRECT_PAYLOAD		
Source:	VideoCS	
Size (in bits):	128	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0	31:0	**Indirect Payload Data Size in bits** Format: U32 Number of bits to be inserted. Not including those skipped bytes in the beginning. For VP9: the Data is always valid from start of cache-line, no offset is allowed.
1..2	63:0	**Indirect Payload Base Address** Format: SplitBaseAddress64ByteAligned 48-bit address of the indirect payload data in memory buffer. **Programming Notes** Payload must begin in a byte position, but the payload can be ended in a bit position.
3	31:0	**Indirect Payload Base Address** Format: MemoryAddressAttributes

Header Forbidden Message Descriptor Control Field

MDC_MHF - Header Forbidden Message Descriptor Control Field

Source: BSpec
Size (in bits): 1
Default Value: 0x00000000

DWord	Bit	Description
0	0	**Message Header Present** Format: Enumeration Indicates the message forbids a message header. Value / Name / Description 0h / No **[Default]** / Message header is not present 1h / Reserved / Not used

Header Present Message Descriptor Control Field

MDC_MHP - Header Present Message Descriptor Control Field

Source: BSpec
Size (in bits): 1
Default Value: 0x00000000

DWord	Bit	Description
0	0	**Message Header Present** Format: Enumeration Specifies if the message uses the optional message header. Value / Name / Description: 0h / No / Message header is not present 1h / Yes / Message header is present

Header Required Message Descriptor Control Field

MDC_MHR - Header Required Message Descriptor Control Field

Source:	BSpec
Size (in bits):	1
Default Value:	0x00000001

DWord	Bit	Description
0	0	**Message Header Present** Format: Enumeration Indicates the message requires a message header. 0h – Reserved – Not used 1h – Yes **[Default]** – Message header is present

HEVC_ARBITRATION_PRIORITY

HEVC_ARBITRATION_PRIORITY

Source: BSpec
Size (in bits): 2
Default Value: 0x00000000

This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface.

DWord	Bit	Description
0	1:0	**Priority** Format: U2 Value / Name: 00b — Highest priority 01b — Second highest priority 10b — Third highest priority 11b — Lowest priority

HW Generated BINDING_TABLE_STATE

HW Generated BINDING_TABLE_STATE

Source:	BSpec
Size (in bits):	16
Default Value:	0x00000000

Description

The binding table binds surfaces to logical resource indices used by shaders and other compute engine kernels. The HW generated Binding_Table_State have different format than the SW generated Binding_Table_State. The HW generated Binding_Table_State is stored as an array of 256 elements, each of which contains one word as defined here. The start of each element is spaced one word apart. The first element of the binding table is aligned to a 64-byte boundary. Binding table indexes beyond 256 will automatically be mapped to entry 0 by the HW, w/ the exception of any messages which support the special indexes 240 through 255, inclusive.

DWord	Bit	Description
0	15:0	**Surface State Pointer** Format: SurfaceStateOffset[21:6]

Hword 1 Block Data Payload

MDP_HW1 - Hword 1 Block Data Payload		
Source:	BSpec	
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.7	255:0	**Hword** Format: U256 Specifies the Hword data

Hword 2 Block Data Payload

MDP_HW2 - Hword 2 Block Data Payload

Source:	BSpec
Size (in bits):	512
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Hword0** Format: U256 Specifies the Hword data for element 0
1.0-1.7	255:0	**Hword1** Format: U256 Specifies the Hword data for element 1

Hword 4 Block Data Payload

MDP_HW4 - Hword 4 Block Data Payload

Source: BSpec

Size (in bits): 1024

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Hword0** Format: U256 Specifies the Hword data for element 0
1.0-1.7	255:0	**Hword1** Format: U256 Specifies the Hword data for element 1
2.0-2.7	255:0	**Hword2** Format: U256 Specifies the Hword data for element 2
3.0-3.7	255:0	**Hword3** Format: U256 Specifies the Hword data for element 3

Hword 8 Block Data Payload

MDP_HW8 - Hword 8 Block Data Payload

Source: BSpec

Size (in bits): 2048

Default Value: 0x00000000, 0x00000000

DWord	Bit	Description
0.0-0.7	255:0	**Hword0** Format: U256 Specifies the Hword data for element 0
1.0-1.7	255:0	**Hword1** Format: U256 Specifies the Hword data for element 1
2.0-2.7	255:0	**Hword2** Format: U256 Specifies the Hword data for element 2
3.0-3.7	255:0	**Hword3** Format: U256 Specifies the Hword data for element 3
4.0-4.7	255:0	**Hword4** Format: U256 Specifies the Hword data for element 4
5.0-5.7	255:0	**Hword5** Format: U256 Specifies the Hword data for element 5

MDP_HW8 - Hword 8 Block Data Payload		
6.0-6.7	255:0	**Hword6** Format: U256 Specifies the Hword data for element 6
7.0-7.7	255:0	**Hword7** Format: U256 Specifies the Hword data for element 7

Hword Channel Mode Message Header Control

MHC_A64_CMODE - Hword Channel Mode Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31	**Reserved** Format: MDC_CMODE Specifies whether the read or write operation occurs on all 4 Dwords if any of those channel enables are set, or else only on the dwords whose corresponding channel enable is set.
	30:0	**Reserved** Format: Ignore Ignored

Hword Register Blocks Message Descriptor Control Field

MDC_DB_HW - Hword Register Blocks Message Descriptor Control Field

Source: BSpec
Size (in bits): 2
Default Value: 0x00000000

DWord	Bit	Description
0	1:0	**Register Blocks** Format: Enumeration Specifies the number of Hword blocks to be read or written

Value	Name	Description
00h	HW1	1 Hword register
01h	HW2	2 Hword registers
02h	HW4	4 Hword registers
03h	HW8	8 Hword registers

Ignored Message Header

MH_IGNORE - Ignored Message Header		
Source:	DataPort 0	
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
Some messages require a message header or have an optional message header, but do not use any information in the header.		
DWord	**Bit**	**Description**
0..7	255:0	**Reserved** Format: Ignore Ignored

Inline Data Description for MFD_AVC_BSD_Object

Inline Data Description for MFD_AVC_BSD_Object

Source: VideoCS

Size (in bits): 96

Default Value: 0x00000000, 0x00000000, 0x00000000

This structure includes all the required Slice Header parameters and error handling settings for AVC_BSD_OBJECT Command (DW3..DW5).

DWord	Bit	Description
0	31	**Concealment Method** This field specifies the method used for concealment when error is detected. If set, a copy from collocated macroblock location is performed from the concealment reference indicated by the ConCeal_Pic_Id field. If it is not set, a copy from the current picture is performed using Intra 16x16 Prediction method. Value / Name / Description: 0 — Intra 16x16 Prediction 1 — Inter P Copy
	30	**Init Current MB Number** When set, the current Slice_Start_MB_Num, Slice_MB_Start_Hor_Pos and Slice_MB_Start_Vert_Pos fields will be used to initialize the Current_MB_Number register. This effectively disables the concealment capability.
	29	**Intra PredMode (4x4/8x8 Luma) Error Control Bit** This field controls if AVC decoder will fix Intra Prediction Mode if the decoded value is incorrect according to MB position Value / Name / Description: 0 — AVC decoder will detect and fix IntraPredMode (4x4/8x8 Luma) Errors. 1 — AVC decoder will NOT detect IntraPredMode (4x4/8x8 Luma) Errors. The wrong IntraPredMode value will be retaind.
	28:27	**MB Error Concealment B Temporal Prediction mode** These two bits control how the reference L0/L1 are overridden in B temporal slice. Value / Name / Description: 00b — **[Default]** — Both Reference Indexes L0/L1 are forced to 0 during Concealment 01b — Only Reference Index L1 is forced to 0; Reference Index L0 is forced to -1 10b — Only Reference Index L0 is forced to 0; Reference Index L1 is forced to -1 11b — Reserved — Invalid
	26	**Reserved** Format: MBZ

Inline Data Description for MFD_AVC_BSD_Object

25 — MB Error Concealment B Temporal Motion Vectors Override Enable Flag

During MB Error Concealment on B slice with Temporal Direct Prediction, motion vectors are forced to 0 to improve image quality.

This bit can be set to preserve the original weight prediction.

Value	Name	Description
0	**[Default]**	Predicted Motion Vectors are used during MB Concealment
1		Motion Vectors are Overridden to 0 during MB Concealment

24 — MB Error Concealment B Temporal Weight Prediction Disable Flag

During MB Error Concealment on B slice with Temporal Direct Prediction, weight prediction is disabled to improve image quality.

This bit can be set to preserve the original weight prediction.

Value	Name	Description
0	**[Default]**	Weight Prediction is Disabled during MB Concealment
1		Weight Prediction will not be overridden during MB Concealment

23:22 — Reserved

Format:	MBZ

21:16 — Concealment Picture ID

This field identifies the picture in the reference list to be used for concealment. This field is only valid if **Concealment Method** is Inter P Copy.

Bit Filed	Value	Defenition
21	0	Frame Picture
21	1	Field picture
20:16	All	Frame Store Index[4:0]

15 — Reserved

Format:	MBZ

14 — BSD Premature Complete Error Handling

BSD Premature Complete Error occurs in situation where the Slice decode is completed but there are still data in the bitstream.

Value	Name	Description
1		Set the interrupt to the driver (provide MMIO registers for MB address R/W)
0		Ignore the error and continue (masked the interrupt), assume the hardware automatically performs the error handling

13 — Reserved

Format:	MBZ

Inline Data Description for MFD_AVC_BSD_Object

12 — MPR Error (MV out of range) Handling

Software must follow the action for each Value as follow:

Value	Name	Description
1		Set the interrupt to the driver (provide MMIO registers for MB address R/W)
0		Ignore the error and continue (masked the interrupt), assume the hardware automatically performs the error handling

11 — Reserved

Format:	MBZ

10 — Entropy Error Handling

Software must follow the action for each Value as follow:

Value	Name	Description
1		Set the interrupt to the driver (provide MMIO registers for MB address R/W).
0		Ignore the error and continue (masked the interrupt), assume the hardware automatically perform the error handling.

9 — Reserved

Format:	MBZ

8 — MB Header Error Handling

Software must follow the action for each Value as follow:

Value	Name	Description
1		Set the interrupt to the driver (provide MMIO registers for MB address R/W).
0		Ignore the error and continue (masked the interrupt), assume the hardware automatically perform the error concealment.

7:6 — MB Error Concealment B Spatial Prediction mode

These two bits control how the reference L0/L1 are overridden in B spatial slice.

Value	Name	Description
00b	**[Default]**	Both Reference Indexes L0/L1 are forced to 0 during Concealment
01b		Only Reference Index L1 is forced to 0; Reference Index L0 is forced to -1
10b		Only Reference Index L0 is forced to 0; Reference Index L1 is forced to -1
11b	Reserved	Invalid

5 — Reserved

Format:	MBZ

4 — MB Error Concealment B Spatial Motion Vectors Override Disable Flag

During MB Error Concealment on B slice with Spatial Direct Prediction, motion vectors are forced to 0 to improve image quality.

This bit can be set to use the predicted motion vectors instead.

This bit does not affect normal decoded MB.

Value	Name	Description
0	**[Default]**	Motion Vectors are Overridden to 0 during MB Concealment

Inline Data Description for MFD_AVC_BSD_Object

		1 | | Predicted Motion Vectors are used during MB Concealment
	3	**MB Error Concealment B Spatial Weight Prediction Disable Flag** During MB Error Concealment on B slice with Spatial Direct Prediction, weight prediction is disabled to improve image quality. This bit can be set to preserve the original weight prediction. This bit does not affect normal decoded MB. Value | Name | Description 0 | **[Default]** | Weight Prediction is Disabled during MB Concealment. 1 | | Weight Prediction will not be overridden during MB Concealment.
	2	**Reserved** Format: | MBZ
	1	**MB Error Concealment P Slice Motion Vectors Override Disable Flag** During MB Error Concealment on P slice, motion vectors are forced to 0 to improve image quality. This bit can be set to use the predicted motion vectors instead. This bit does not affect normal decoded MB. Value | Name | Description 0 | **[Default]** | Motion Vectors are Overridden to 0 during MB Concealment 1 | | Predicted Motion Vectors are used during MB Concealment
	0	**MB Error Concealment P Slice Weight Prediction Disable Flag** During MB Error Concealment on P slice, weight prediction is disabled to improve image quality. This bit can be set to preserve the original weight prediction. This bit does not affect normal decoded MB. Value | Name | Description 0 | **[Default]** | Weight Prediction is Disabled during MB Concealment. 1 | | Weight Prediction will not be overridden during MB Concealment.
1	31:16	**First MB Byte Offset of Slice Data or Slice Header** Programming Notes MFX supports only DXVA2 Long and Short Format.
	15:8	**Reserved** Format: | MBZ
	7	**Fix Prev Mb Skipped** Enables an alternative method for decoding mb_skipped, to cope with an encoder that codes a skipped MB as a direct MB with no coefficient.
	6:5	**Reserved** Format: | MBZ Programming Notes

Inline Data Description for MFD_AVC_BSD_Object

		Please note that the field MUST be set to '0' at this time.
	4	**Emulation Prevention Byte Present** Value / Name / Description 0 / / H/W needs to perform Emulation Byte Removal 1 / / H/W does not need to perform Emulation Byte Removal
	3	**LastSlice Flag** It is needed for both error concealment at the end of a picture (so, no more phantom slice. It is also needed to know to set the last MB in a picture correctly. Value / Name / Description 1 / / If the current Slice to be decoded is the very last slice of the current picture. 0 / / If the current Slice to be decoded is any slice other than the very last slice of the current picture
	2:0	**First Macroblock (MB)Bit Offset** Exists If: //AVC Long Format Only Format: U3 This field provides the bit offset of the first macroblock of the Slice in the first byte of the input compressed bitstream.
2	31	**I Slice Concealment Mode** This field controls how AVC decoder handle MB concealment in I Slice Value / Name 0 / Intra Concealment 1 / Inter Concealment **Programming Notes** If this field is set to "1" (Inter Concealment), driver must provide a valid reference picture (programmed using "Concealment Reference Picture" field) for concealment reference picture. In this mode, weight prediction is disabled and motion vectors are forced to 0 as well.
	30	**Reserved** Format: MBZ
	29:24	**Concealment Reference Picture + Field Bit** Format: U6 This field provides the concealment reference picture for hardware to conceal in case driver wants to specify one concealment picture. This field matches with the DPB order sent to hardware. This field applies to all I/P/B slices Bit Filed / Value / Defenition 29 / MBZ / is reserved for future expansion

Inline Data Description for MFD_AVC_BSD_Object

28:25	All	Reference PIcture Number
24	All	Field Bit(if the current picture is a field picture [Frame picture must be 0]

23 P Slice Concealment Mode

This field controls how AVC decoder handle MB concealment in P Slice

Value	Name
1	Intra Concealment
0	Inter Concealment

22:19 Reserved

Format:	MBZ

18:16 P Slice Inter Concealment Mode

This field controls how AVC decoder select reference picture for Concealment in P Slice.

Value	Name	Description
000b		Top of Reference List L0 (Use top entry of Reference List L0)
001b		Driver Specified Concealment Reference
010b		Predicted Reference (Use reference picture predicted using P-Skip Algorithm)
011b		Temporal Closest (Using POC to select the closest forward picture) [For L0: Closest POC smaller than current POC]
100b		First Long Term Picture in Reference List L0 (If no long term picture available, use Temporal Closest Picture)
101b-111b	Reserved	

15 B Slice Concealment Mode

This field controls how AVC decoder handle MB concealment in B Slice

Value	Name
1	Intra Concealment
0	Inter Concealment

14 Reserved

Format:	MBZ

13:12 B Slice Inter Direct Type Concealment Mode

AVC decoder can use Spatial or Temporal Direct for B Skip/Direct.

This field determine can override the mode on how AVC decoder handles MB concealment in B slice.

Value	Name	Description
00b		Use Default Direct Type (slice programmed direct type)
01b		Forced to Spatial Direct Only
10b		Forced to Temporal Direct Only

Inline Data Description for MFD_AVC_BSD_Object

11b		Spatial Direct without Temporal Componenet (MovingBlock information)

11 — Reserved

Format:	MBZ

10:8 — B Slice Spatial Inter Concealment Mode

This field controls how AVC decoder select reference picture for Spatial Inter Concealment in B Slice.

Value	Name	Description
000b		Top of Reference List L0/L1 (Use top entry of Reference List L0/L1).
001b		Driver Specified Concealment Reference
011b		Temporal Closest (Using POC to select the closest forward picture) [For L0: Closest POC smaller than current POC] [For L1: Closest POC larger than current POC]
100b		" First Long Term Picture in Reference List L0/L1 (If no long term picture available, use Temporal Closest Picture)
101b-111b	Reserved	

7 — Reserved

Format:	MBZ

6:4 — B Slice Temporal Inter Concealment Mode

This field controls how AVC decoder select reference picture for Temporal Inter Concealment in B Slice

Value	Name	Description
000b		Top of Reference List L0/L1 (Use top entry of Reference List L0/L1)
001b		Driver Specified Concealment Reference
010b		Predicted Reference (Use reference picture predicted using B-Skip Algorithm)
011b		" Temporal Closest (Using POC to select the closest forward picture) [For L0: Closest POC smaller than current POC] [For L1: Closest POC larger than current POC]
100b		First Long Term Picture in Reference List L0/L1 (If no long term picture available, use Temporal Closest Picture)
101b-111b	Reserved	

3:2 — Reserved

Format:	MBZ

1 — Intra 8x8/4x4 Prediction Error Concealment Control Bit

This field controls if AVC goes into MB concealment mode (next MB) when an error is detected on Intra8x8/4x4 Prediction Mode (these 2 modes have fixed coding so it may not affect the bitstream.

Inline Data Description for MFD_AVC_BSD_Object

Value	Name	Description
0		AVC decoder will NOT go into MB concealment when Intra8x8/4x4 Prediction mode is incorrect.
1		AVC decoder will go into MB concealment when Intra8x8/4x4 Prediction mode is incorrect.

0

Intra Prediction Error Control Bit (applied to Intra16x16/Intra8x8/Intra4x4 Luma and Chroma)

This field controls if AVC decoder will fix Intra Prediction Mode if the decoded value is incorrect according to MB position.

Value	Name	Description
0		AVC decoder will detect and fix Intra Prediction Mode Errors.
1		AVC decoder will retain the Intra Prediction value decoded from bitstream.

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

This structure corresponds to Dw3..6 of MFX_VP8_PAK_OBJECT Command.

DWord	Bit	Description
0	31:23	**Reserved** Format: MBZ
	22:20	**MV Format(Motion Vector Size)** Exists If: //IntraMbFlag = 0 This field specifies the size and format of the output motion vectors. Value / Name / Description: 000b – Intra MB – No Motion vectors 100b – Inter Predict MB (Unpacked Motion Vector Mode) – Sixteen Motion Vectors Per MacroBlock Others – Reserved **Programming Notes** This field MBZ, when the **IntraMbFlag = 1**.
	19:18	**SegmentID** Format: U2 Segment number 0-3
	17	**Enable Coeff Clamp** Value / Name / Description: 1 – Magnitude of coefficients of the current MB is clamped based on the clamping matrix after quantization 0 – No Clamping
	16:14	**Reserved** Format: MBZ
	13	**Intra MB Flag** This field specifies whether the current macroblock is an Intra (I) Macroblock. For Key pictures (IsKyeFrameFlag DW2, bit[5] of MFX_VP8_PIC_STATE), this field must be set to 1. Value / Name: 0h – INTER (Inter MacroBlock)

Inline Data Description - VP8 PAK OBJECT

		1h: INTRA (Intra MacroBlock)

Programming Notes
For I-picture MB (Intra MB Flag =1), this field must be set to 1.

12:11 **RefPicSelect**

This field specifies which reference pic (among Last Frame, Golden Frame and Alt Frame) is selected for the current macroblock when Intra MB Flag = 0 .

Value	Name
00b	Last Frame
01b	Golden Frame
10b	Alt Frame

10:8 **MB Type 3-Bits - Inter/Intra MB**

MB Type 3 Bits [10:8] specifies InterMB MV mode configurations: 16x16 or 2 16x8 or 4 8x8 or 16 4x4 when Intra MB Flag = 0 and bit [8] = IntraMB mode configurations: 4x4 or 16x16 when Intra MB Flag = 1

Value	Name	Description
000b	16x16	**Inter MB** Only DW 6 bits 3:0 are used to indicate MVMode, MVMode can't be split
001b	2 16x8 (mv_Top Bottom)	**Inter MB [10:8]** Split MV is inferred. DW5 bits[3:0] are used for MVMode for first 16x8 partition, DW6 bits[3:0] are used for MVMode for second 16x8 partition.
010b	2 8 x16 (mv_left_right)	**Inter MB [10:8]** Split MV is inferred. DW5 bits[3:0] are used for MVMode for first 8x16 partition, DW5 bits[11:8] are used for MVMode for second 8x16 partition.
011b	4 8x8 (mv_quarters)	**Inter MB [10:8]** Split MV is inferred. DW5 bits[3:0] are used for MVMode for first 8x8 partition. DW5 bits[11:8] are used for MvMode for second 8x8 partition. DW6 bits[3:0] are used for MVMode for third 8x8 partition. DW6 bits[11:8] are used for MVMode for fourth 8x8 partition.
100b	16 4x4 (mv_16)	**Inter MB [10:8]** Split MV is inferred. There are 16 partitions. Each Sub-block uses 4 bits in DW6 and DW7.
0b	16x16	**Intra MB [8]** Only DW5, bits[3:0] are used for Y mode. For B_PRED, "16 4x4" should be used which implies B_PRED mode.
1b	16 4x4	**Intra MB [8]** All bits in DW5 and DW6 are used to represent B_PRED modes (Bmodes) in each sub-blocks.

INTERFACE_DESCRIPTOR_DATA

INTERFACE_DESCRIPTOR_DATA

Source: RenderCS

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:6	**Kernel Start Pointer** Format: InstructionBaseOffset[31:6]Kernel Specifies the 64-byte aligned address offset of the first instruction in the kernel. This pointer is relative to the **Instruction Base Address.**
	5:0	**Reserved** Format: MBZ
1	31:16	**Reserved** Format: MBZ
	15:0	**Kernel Start Pointer High** Format: InstructionBaseOffset[47:32]Kernel This field specifies the high 16 bits of starting address of the Kernel Pointer.
2	31:20	**Reserved** Format: MBZ
	19	**Denorm Mode** This field specifies how Float denormalized numbers are handles in the dispatched thread. Value / Name / Description: 0h / Ftz / Float denorms will be flushed to zero when appearing as inputs; denorms will never come out of instructions. Double precision float and half precision float numbers are not flushed to zero. 1h / SetByKernel / Denorms will be handled in by kernel.
	18	**Single Program Flow** Specifies whether the kernel program has a single program flow (SIMDnxm with m = 1) or multiple program flows (SIMDnxm with m > 1). Value / Name: 0h / Multiple 1h / Single
	17	**Thread Priority** Specifies the priority of the thread for dispatch. Value / Name:

INTERFACE_DESCRIPTOR_DATA

		0h: Normal Priority 1h: High Priority
	16	**Floating Point Mode** Specifies the floating point mode used by the dispatched thread. Value: 0h — Name: IEEE-754 Value: 1h — Name: Alternate
	15:14	**Reserved** Format: MBZ
	13	**Illegal Opcode Exception Enable** Format: Enable This bit gets loaded into EU CR0.1[12] (note the bit # difference). See *Exceptions and ISA Execution Environment*.
	12	**Reserved** Format: MBZ
	11	**Mask Stack Exception Enable** Format: Enable This bit gets loaded into EU CR0.1[11]. See *Exceptions and ISA Execution Environment*.
	10:8	**Reserved** Format: MBZ
	7	**Software Exception Enable** Format: Enable This bit gets loaded into EU CR0.1[13] (note the bit # difference). See *Exceptions and ISA Execution Environment*.
	6:0	**Reserved** Format: MBZ
3	31:5	**Sampler State Pointer** Format: DynamicStateOffset[31:5]SAMPLER_STATE Specifies the 32-byte aligned address offset of the sampler state table. This pointer is relative to the **Dynamic State Base Address.** *This field is ignored for child threads.*
	4:2	**Sampler Count** Format: U3 Specifies how many samplers (in multiples of 4) the kernel uses. Used only for prefetching the

INTERFACE_DESCRIPTOR_DATA

associated sampler state entries.
This field is ignored for child threads.
If this field is not zero, sampler state is prefetched for the first instance of a root thread upon the startup of the media pipeline.

Value	Name
[0,4]	
0h	No samplers used
1h	Between 1 and 4 samplers used
2h	Between 5 and 8 samplers used
3h	Between 9 and 12 samplers used
4h	Between 13 and 16 samplers used

1:0 Reserved

Format:	MBZ

4 — 31:16 Reserved

Format:	MBZ

15:5 Binding Table Pointer

Format:	SurfaceStateOffset[15:5]BINDING_TABLE_STATE*256

Description
Specifies the 32-byte aligned address of the binding table. This pointer is relative to the **Surface State Base Address**. *This field is ignored for child threads.*

4:0 Binding Table Entry Count

Format:	U5

Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state.
This field is ignored for child threads.
If this field is not zero, binding table and surface state are prefetched for the first instance of a root thread upon the startup of the media pipeline.

Value	Name
[0,31]	

Programming Notes
The maximum number of prefetched binding table entries is limited to 31. For kernels using a large number of binding table entries, it may be wise to set this field to zero to avoid prefetching too many entries and thrashing the state cache.

5 — 31:16 Constant/Indirect URB Entry Read Length

Format:	U16

Specifies the amount of URB data read and passed in the thread payload for the Constant or

INTERFACE_DESCRIPTOR_DATA

Indirect URB entry, in 8-DW register increments. A value 0 means that no Constant or Indirect URB Entry will be loaded. The Constant URB Entry Read Offset field will then be ignored. In GPGPU mode this describes how much data is delivered in a single dispatch. Multiple dispatches in a thread group will deliver constant data offset by this value. The total amount of constant data is (Constant URB Read Length * Number of Threads in GPGPU Thread Group + Cross-Thread Constant Data Read Length).

If **Cross-Thread Constant Data Read Length** for Indirect is greater than 0, then this field must also be greater than 0. The allowed combinations are:

Constant/Indirect URB Entry Read Length **Entry Read Length**	Cross-Thread Constant **Data Read Length**	Notes
=0	=0	No Payload
>0	=0	Per-thread payload only
>0	>0	Both kinds of payload
=0	>0	Only for CURBE payloads

Value	Name
[0,63]	

15:0 **Constant URB Entry Read Offset**

Format:	U16

Specifies the offset (in 8-DW units) at which Constant URB data is to be read from the URB before being included in the thread payload.

Value	Name	Description
[0,1983]		Indicating [0,1983] 256-bit register increments. ROB has 64KB of storage; 2048 entries. However, lowest 64 entries are reserved for VFE/TS to store interface descriptor data. Hence, (URB Entry Read Offset + Read Length) shall not exceed 1984.

6 31:24 **Reserved**

Format:	MBZ

23:22 **Rounding Mode**

Format:	U2

Value	Name	Description
00b	RTNE **[Default]**	Round to Nearest Even
01b	RU	Round toward +Infinity
10b	RD	Round toward -Infinity
11b	RTZ	Round toward Zero

INTERFACE_DESCRIPTOR_DATA

21 Barrier Enable

Format:	Enable

This field specifies whether the thread group requires a barrier. If not, it can be dispatched without allocating one.

20:16 Shared Local Memory Size

Format:	U5

This field indicates how much Shared Local Memory the thread group requires. The amount is specified in 4k blocks, but only powers of 2 are allowed: 0, 4k, 8k, 16k, 32k and 64k per half-slice.

Uses a different encoding to allow encodings for the new 1k and 2k SLM sizes.

Value	Name	Description
0	Encodes 0K	No SLM used
1	Encodes 1K	
2	Encodes 2K	
3	Encodes 4K	
4	Encodes 8K	
5	Encodes 16K	
6	Encodes 32K	
7	Encodes 64K	

15 Global Barrier Enable

Format:	Enable

Description
This field when set indicates that the thread group associated with this barrier is allowed to cross sub-slices with a performance penalty. When this field is clear, the thread group is dispatched to a single sub-slice or pool. Note that SLM should not be used with a Global Barrier since SLM is always forced to a single sub-slice or pool. The Barrier Enable bit must be set to enable the barrier, since this bit only specifies the type of barrier.
Restriction : Global barriers cannot be used. Must be zero.

14:13 Reserved

Format:	MBZ

12:10 Reserved

Format:	MBZ

INTERFACE_DESCRIPTOR_DATA

	9:0	**Number of Threads in GPGPU Thread Group** Format: U10 Specifies the number of threads that are in this thread group. The minimum value is 1, while the maximum value is the number of threads in a subslice for local barriers. See vol1b Configurations for the number of threads per subslice for different products. The maximum value for global barriers is limited by the number of threads in the system, or by 511, whichever is lower. This field should not be set to 0 even if the barrier is disabled, since an accurate value is needed for proper pre-emption.
7	31:8	**Reserved** Format: MBZ
	7:0	**Cross-Thread Constant Data Read Length** Format: U8 Specifies the amount of constant data in CURBE in 8-DW register increments which will be sent to every thread in the thread group in addition to the per thread ids specified by **Constant URB Entry Read Length**. **Value** [0,127] — **Name**

INTERRUPT

INTERRUPT

Source: BSpec
Access: RO, R/W, R/WC, R/W
Size (in bits): 128
Default Value: 0x00000000, 0xFFFFFFFF, 0x00000000, 0x00000000

See the Interrupt Definition Tables to find the source event for each interrupt bit.
There are multiple instances of this register format.

DWord	Bit	Description
0	31:0	**ISR** Access: RO These are the Interrupt Status Register Bits. This field contains the non-persistent values of the interrupt status bits. The IMR selects which of these interrupt conditions are reported in the persistent IIR **Value** / **Name** 0b – Condition Doesn't exist 1b – Condition Exists **Restriction** Restriction : Some inputs to this register are short pulses. Do not use this register to sample these conditions.
1	31:0	**IMR** Access: R/W These are the Interrupt Mask Register Bits. This field contains a bit mask which selects which interrupt bits from the ISR are reported in the IIR. **Value** / **Name** FFFFFFFFh – All interrupts masked **[Default]** 0b – Not Masked 1b – Masked **Restriction** Restriction : For GT interrupts DO NOT use this register to mask interrupt events. Instead program this IMR to all 0s and use the individual GT command streamer MASK bits in the GT register space. This prevents unneeded messaging to DE.
2	31:0	**IIR** Access: R/WC These are the Interrupt Identity Register Bits.

<table>
<tr><th colspan="3">INTERRUPT</th></tr>
<tr><td></td><td></td><td>This field holds the persistent values of the interrupt bits from the ISR which are unmasked by the IMR.
The IER enables an interrupt to be generated when the corresponding bit in the IIR becomes set. A disabled interrupt will still appear in the IIR.
Bits set in this register will remain set (persist) until the interrupt condition is cleared by writing a '1' to the appropriate bits.
<table>
<tr><th>Value</th><th>Name</th></tr>
<tr><td>0b</td><td>Condition Not Detected</td></tr>
<tr><td>1b</td><td>Condition Detected</td></tr>
</table>
<table>
<tr><th>Programming Notes</th></tr>
<tr><td>For each bit, the IIR can store a second pending interrupt if two or more of the same interrupt conditions occur before the first condition is cleared. Upon clearing the first interrupt, the IIR bit will momentarily go low, then return high to indicate there is second interrupt pending.</td></tr>
</table></td></tr>
<tr><td>3</td><td>31:0</td><td>IER
<table>
<tr><td>Access:</td><td>R/W</td></tr>
</table>
These are the Interrupt Enable Register Bits.
The field enables an interrupt to be generated when the corresponding bit in the IIR becomes set. A disabled interrupt will still appear in the IIR.
<table>
<tr><th>Value</th><th>Name</th></tr>
<tr><td>0b</td><td>Disabled</td></tr>
<tr><td>1b</td><td>Enabled</td></tr>
</table>
<table>
<tr><th>Programming Notes</th></tr>
<tr><td>The master interrupt enable must be set to 1b for any of these enabled interrupts to propagate to PCI device 2 interrupt processing.</td></tr>
</table></td></tr>
</table>

Invalidate After Read Message Descriptor Control Field

MDC_IAR - Invalidate After Read Message Descriptor Control Field

Source:	BSpec
Size (in bits):	1
Default Value:	0x00000000

DWord	Bit	Description
0	0	**Reserved** Format: MBZ Previously, this Enable field was intended to optimize scratch and spill/fill read messages, where the memory was only used by a single thread and did not need to be maintained after the thread completed. If enabled, it caused all lines in the L3 cache accessed by the message to be invalidated after the read occurred, regardless of whether the line contained modified data. It was intended as a performance hint indicating that the data would no longer be used to avoid writing back data to memory.

JPEG

JPEG		
Source:	VideoCS	
Size (in bits):	16	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	15:5	**Reserved** Format: MBZ
	4	**Inconsistent VLD SE Error** This flag indicates an inconsistent SE coded in the bit-stream. Bit-stream does not match any entries in the hauffman table.
	3	**Extra Block Error** This flag indicates extra block coded within an ECS data boundary.
	2	**Missing block Error** This flag indicates one or more blocks are missing within an ECS data boundary.
	1	**Extra ECS Error** This flag indicates extra ECS' coded in the bit-stream SCAN payload data.
	0	**Missing ECS Error** This flag indicates one or more ECS' are missing from the bit-stream SCAN payload data.

LOD Message Address Payload Control

MACD_LOD - LOD Message Address Payload Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:4	**Reserved** Format: MBZ Ignored
	3:0	**LOD** Format: U4 Specifies the LOD for this slot. Value: [0,14] — Name: — Description: representing LOD

Lower Oword Block Data Payload

MDP_OW1L - Lower Oword Block Data Payload		
Source:	BSpec	
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.3	127:0	**Oword** Format: U128 Specifies the upper Oword data element
0.4-0.7	127:0	**Reserved** Format: Ignore Ignored

LRI Data Entry

LRI_DATA - LRI Data Entry

Source: RenderCS

Size (in bits): 64

Default Value: 0x00000000, 0x00000000

Each LRI command header is followed by LRI_DATA entries. Each of these entries is a pair of Dwords: the MMIO register address and the data to be written.

DWord	Bit	Description
0..1	63:55	**Reserved** Format: MBZ
	54:32	**MMIO** Format: U23 **Programming Notes** Bits [1:0] MBZ
	31:0	**Data** Format: U32

MEDIA_SURFACE_STATE

MEDIA_SURFACE_STATE

Source:	BSpec
Exists If:	//([MessageType] == 'Deinterlace') OR ([MessageType] == 'Sample_8x8')
Size (in bits):	256
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

This is the SURFACE_STATE used by only deinterlace, sample_8x8, and VME messages.

DWord	Bit	Description
0	31:30	**Rotation** Value / Name: 00b — No Rotation or 0 Degree 01b — 90 Degree Rotation 10b — 180 Degree Rotation 11b — 270 Degree Rotation **Programming Notes** Rotation is only supported only with AVS function messages and not with HDC direct write and 16x8 AVS messages.
	29:27	**Reserved** Format: MBZ
	26:20	**X Offset** Exists If: //[Surface Format] is one of Planar Formats Format: PixelOffset[8:2] This field specifies the horizontal offset in pixels from the **Surface Base Address** to the start (origin) of the surface. This field effectively loosens the alignment restrictions on the origin of tiled surfaces. Previously, tiled surface origin was (by definition) located at the base address, and thus needed to satisfy the 4KB base address alignment restriction. Now the origin can be specified at a finer (4-wide x 4-high pixel) resolution. Value / Name / Description: [0,508] — In multiples of 4 (low 2 bits missing) **Programming Notes** For linear surfaces and Packed Formats, this field must be zero. For **Surface Format** with 8 bits per element, this field must be a multiple of 16. For **Surface Format** with 16 bits per element, this field must be a multiple of 8.

MEDIA_SURFACE_STATE

	26:16	**Reserved** Exists If: //[Surface Format] is not one of Planar Formats Format: MBZ
	19:16	**Y Offset** Exists If: //[Surface Format] is one of Planar Formats Format: RowOffset[5:2] This field specifies the vertical offset in rows from the **Surface Base Address** to the start of the surface. (See additional description in the **X Offset** field) **Value** / **Name** / **Description**: [0,28] / / In multiples of 4 (low two bits missing) **Programming Notes**: For linear surfaces and Packed Formats, this field must be zero.
	15:12	**Reserved** Format: MBZ
	11:0	**Reserved** Format: MBZ
1	31:18	**Height** Format: U14-1 This field specifies the height of the surface in units of pixels. For PLANAR surface formats, this field indicates the height of the Y (luma) plane. **Value** / **Name** / **Description** / **Exists If**: [0,16383] / / representing heights [1,16384] / [Surface Type] != FM_STRBUF_* **Programming Notes**: Height (field value + 1) must be a multiple of 2 for PLANAR_420 surfaces.If Vertical Line Stride is 1, this field indicates the height of the field, not the height of the frame.
	17:4	**Width** Format: U14-1 This field specifies the width of the surface in units of pixels. For PLANAR surface formats, this field indicates the width of the Y (luma) plane. **Value** / **Name** / **Description** / **Exists If**: [0,16383] / / representing widths [1,16384] / [Surface Type] != FM_STRBUF_* **Programming Notes**: • The Width specified by this field multiplied by the pixel size in bytes must be less than or equal to the surface pitch (specified in bytes via the Surface Pitch field). • Width (field value + 1) must be a multiple of 2 for PLANAR_420, PLANAR_422, and all

MEDIA_SURFACE_STATE

YCRCB_* and Y16_UNORM surfaces, and must be a multiple of 4 for PLANAR_411 and Y8_UNORM_VA surfaces.

- For deinterlace messages, the Width (field value + 1) must be a multiple of 8.

- For Y8_UNORM_VA format width should be in multiple of 4, for Y16_UNORM_VA format width should be in multiple of 2, for Y1_UNORM format width should be in multiple of 32
- When Address Control = Mirror, the total width should be in multiple of 4bytes.

Width (field value + 1) must be a multiple of 2 for PLANAR_420_16

3:2 **Picture Structure**

Specifies the encoding of the current picture.

Value	Name
00b	Frame Picture
01b	Top Field Picture
10b	Bottom Field Picture
11b	Invalid, not allowed

1:0 **Cr(V)/Cb(U) Pixel Offset V Direction**

Default Value:	0
Format:	U0.2

Description
Specifies the distance to the U/V values with respect to the even numbered Y channels in the V direction

Programming Notes
This field is ignored for all formats except PLANAR_420_8
This offset has been increased from 2 bits to 3 bits to support U1.2 format, and the MSB bit is added as Pixel Offset V Direction MSB in DWord 2. Valid values for the combined field range from 0 to 4.

2 31:27 **Surface Format**

Description
Specifies the format of the surface. All of the Y and G channels will use table 0 and all of the Cr/Cb/R/B channels will use table 1.
Note: Y8_UNORM_VA, Y16_UNORM and Y16_SNORM are used for all functions of sample_8x8 except AVS where rest of the formats are not used. These two formats are packed as 32bits in L1 though the individual pixels are either 8bpp or 16bpp respectively.

Value	Name	Description

MEDIA_SURFACE_STATE

0	YCRCB_NORMAL	
1	YCRCB_SWAPUVY	
2	YCRCB_SWAPUV	
3	YCRCB_SWAPY	
4	PLANAR_420_8	
5	Y8_UNORM_VA	Sample_8x8 only except AVS
6	Y16_SNORM	Sample_8x8 only except AVS
7	Y16_UNORM_VA	Sample_8x8 only except AVS
8	R10G10B10A2_UNORM	Sample_8x8 only
9	R8G8B8A8_UNORM	Sample_8x8 AVS only
10	R8B8_UNORM (CrCb)	Sample_8x8 AVS only
11	R8_UNORM (Cr/Cb)	Sample_8x8 AVS only
12	Y8_UNORM	Sample_8x8 AVS only
13	A8Y8U8V8_UNORM	Sample_8x8 AVS only
14	B8G8R8A8_UNORM	Sample_8x8 AVS only
15	R16G16B16A16	Sample_8x8 AVS only
16	Y1_UNORM	Sample_8x8 only for boolean surfaces (1bit/pixel)
17	Y32_UNORM	For Integral Image (32bpp)
18	PLANAR_422_8	Sample_8x8 AVS only
Others	Reserved	

26 **Interleave Chroma**

Format:	Enable

This field indicates that the chroma fields are interleaved in a single plane rather than stored as two separate planes. This field is only used for PLANAR surface formats.

25 **Cr(V)/Cb(U) Pixel Offset U Direction**

Default Value:	0
Format:	U0.1

Description

Specifies the distance to the U/V values with respect to the even numbered Y channels in the U direction

Programming Notes

This field must be zero for all formats except PLANAR_420_8, PLANAR_422_8, YCRCB_NORMAL, YCRCB_SWAPUVY, YCRCB_SWAPUV, YCRCB_SWAPY.

MEDIA_SURFACE_STATE

24 **Cr(V)/Cb(U) Pixel Offset V Direction MSB**

Default Value:	0
Format:	U1

Description
Specifies the distance to the U/V values with respect to the even numbered Y channels in the V direction

Programming Notes
This field must be zero for all formats except PLANAR_420_8.
This offset has been increased from 2 bits to 3 bits as U1.2 format and this bit is used in conjunction with the bits in the Cr(V)/Cb(U) Pixel Offset V Direction field in DWord 1, which contain the rest of the bits for offset V-direction. Valid values for the combined field range from 0 to 4.

23 **Memory Compression Mode**

Distinguishes Vertical from Horizontal compression.

Value	Name	Description
0	Horizontal Compression Mode **[Default]**	
1	Vertical Compression Mode	

22 **Memory Compression Enable**

Format:	Enable

This surface may contain compressed or compressible pixels. Memory compression will be attempted for writes to this surface. Reads from this surface will check for compressed data.

Programming Notes
The compression control must have 0 value for non-tileY modes.
Please refer to vol1a Memory Data Formats chapter -- section Media Memory Compression for more details, including format restrictions.

21 **Address Control**

Value	Name	Description
0	CLAMP	Clamp
1	MIRROR	Mirror

20:3 **Surface Pitch**

Format:	U18-1 pitch in Bytes

This field specifies the surface pitch in (#Bytes - 1).

Value	Name	Description
[0,262143]		For other linear surfaces: representing [1B, 256KB]
[511, 262143]		For X-tiled surface: representing [512B, 256KB] = [1 tile, 512 tiles]
[127, 262143]		For Y-tiled surfaces: representing [128B, 256KB] = [1 tile, 2048 tiles]

MEDIA_SURFACE_STATE

Programming Notes
For tiled surfaces, the pitch must be a multiple of the tile widthIf Half Pitch for Chroma is set, this field must be a multiple of two tile widths for tiled surfaces, or a multiple of 2 bytes for linear surfaces.The Surface Pitches of current picture and reference picture should be declared as the identical type in VDI mode with identical Height, Width and Format.
If Media Memory Compression is enabled, the following max pitch size restriction must be honored. For larger resolution, Media Memory compression Must be disabled. Tiling Mode Pixel Format Max Frame Width (bytes) Max Frame Width (pixels) Max Pitch (bytes) Legacy 4K 8bpp 16k 16k 16k + 127 16bpp 16k 8k 16k + 127 32bpp 16k 4k 16k + 127 64bpp 16k 2k 16k + 127 128bpp 16k 1k 16k + 127 TileYF 8bpp 8k 8k 8k + 63 16bpp 16k 8k 16k + 127 32bpp 16k 4k 16k + 127 64bpp 16k 2k 16k + 255 128bpp 16k 1k 16k + 255 TileYS 8bpp 16k 16k 16k + 255 16bpp 16k 8k 16k + 511 32bpp 16k 4k 16k + 511 64bpp 16k 2k 16k + 1023 128bpp 16k 1k 16k + 1023

2 **Half Pitch for Chroma**

Format:	Enable

This field indicates that the chroma plane(s) will use a pitch equal to half the value specified in the Surface Pitch field. This field is only used for PLANAR surface formats.

Programming Notes
Must be Zero as this field is not used.

1:0 **Tile Mode**

Format:	U2 Enumerated Type

This field specifies the type of memory tiling (Linear, WMajor, XMajor, or YMajor) employed to tile this surface. See Memory Interface Functions for details on memory tiling and restrictions.

Value	Name	Description
0h	TILEMODE_LINEAR	Linear mode (no tiling)
1h	Reserved	Reserved
2h	TILEMODE_XMAJOR	X major tiling
3h	TILEMODE_YMAJOR	Y major tiling

Programming Notes

- Refer to *Memory Data Formats* for restrictions on TileMode direction for the various buffer types. (Of particular interest is the fact that YMAJOR tiling is not supported for display/overlay buffers).
- The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this field.
- Linear surfaces can be mapped to Main Memory (uncached) or System Memory (cacheable, snooped). Tiled (X/Y/W) surfaces can only be mapped to Main Memory.

MEDIA_SURFACE_STATE

3	31:30	**Reserved** Format: MBZ
	29:16	**X Offset for U(Cb)** Format: U14 Pixel Offset **Description** For non planar surfaces this field specifies the horizontal offset in pixels from the Surface Base Address to the start (origin) of the surface. For Planar surfaces this field specifies the horizontal offset in pixels from the Y-plane origin to the start (origin) of the U(Cb) plane or the interleaved UV plane if Interleave Chroma is enabled. Resultant X-offset = 'X-offset of the surface (Y-plane)' + 'X offset for U(Cb)' For TileYS and TileYF this offset should be integral multiple of Tile width of Luma plane. **Programming Notes** For PLANAR_420 and PLANAR_422 surface formats, this field must indicate an even number of pixels.
	15:14	**Reserved** Format: MBZ
	13:0	**Y Offset for U(Cb)** Format: U14 Row Offset **Description** For non planar surfaces this field specifies the vertical offset in pixels from the Surface Base Address to the start (origin) of the surface. For Planar surfaces this field specifies the vertical offset in rows from the Y-plane origin to the start (origin) of the U(Cb) plane or the interleaved UV plane if Interleave Chroma is enabled. Resultant X-offset = 'Y-offset of the surface (Y-plane)' + 'Y offset for U(Cb)' For TileYS and TileYF this offset should be integral multiple of Tile width of Luma plane. **Programming Notes** This field must be aligned by 4 bit[1:0] = 00 This field must be aligned by 4 bit[1:0] = 00 for all format besides PLANAR_420_*
4	31:30	**Reserved** Format: MBZ
	29:16	**X Offset for V(Cr)** Exists If: //([Surface Format] is one of planar) AND ([Interleave Chroma] == '0') Format: U14 Pixel Offset

MEDIA_SURFACE_STATE

		Description For Planar surfaces this field specifies the horizontal offset in pixels from the Y-plane origin to the start (origin) of the V(Cb) plane. Resultant X-offset = 'X-offset of the surface (Y-plane)' + 'X offset for V(Cb)' For TileYS and TileYF this offset should be integral multiple of Tile width of Luma plane. **Programming Notes** For PLANAR_420 and PLANAR_422 surface formats, this field must indicate an even number of pixels.
	15	**Reserved** Format: MBZ
	14:0	**Y Offset for V(Cr)** Exists If: //([Surface Format] is one of planar) AND ([Interleave Chroma] == '0') Format: U15 Row Offset **Description** For Planar surfaces this field specifies the vertical offset in rows from the Y-plane origin to the start (origin) of the V(Cb) plane. Resultant Y-offset = 'Y-offset of the surface (Y-plane)' + 'Y offset for V(Cb)' For TileYS and TileYF this offset should be integral multiple of Tile width of Luma plane. **Programming Notes** This field must indicate a multiple of 4 (bit 0 & 1 = 00).
5	31	**Vertical Line Stride** Format: U1 in lines to skip between logically adjacent lines For Surfaces accessed via the sample_8x8 message:Specifies number of lines (0 or 1) to skip between logically adjacent lines - provides support of interleaved (field) surfaces as textures.For Other Surfaces:Vertical Line Stride must be zero.
	30	**Vertical Line Stride Offset** Format: U1 in lines of initial offset (when Vertical Line Stride == 1) For Surfaces accessed via the sample_8x8 message: Specifies the offset of the initial line from the beginning of the buffer. For Other Surfaces: Vertical Line Stride Offset must be zero. **Programming Notes** This field must be set to 0 if Vertical Line Stride is 0.
	29:24	**Reserved** Format: MBZ

MEDIA_SURFACE_STATE

	23:20	**Reserved** Format: MBZ
	19:18	**Tiled Resource Mode** Format: U2 **For Sampling Engine, Render Target, and Typed/Untyped Surfaces:** This field specifies the tiled resource mode. **For other surfaces:** This field is ignored.

Value	Name	Description
0h	TRMODE_NONE	No tiled resource
1h	TRMODE_TILEYF	4KB tiled resources
2h	TRMODE_TILEYS	64KB tiled resources
3h	Reserved	

Programming Notes
If **Tile Mode** is not set to TILEMODE_YMAJOR, this field must be set to TRMODE_NONE.
If this field is not set to TRMODE_NONE, the **Surface Format** must be one with 8, 16, 32, 64, or 128 bits per element, or one of the compressed texture modes (BC*, ETC*, EAC*, ASTC*). Additionally, YCRCB* formats are supported and treated as 16 bits per element, and the PLANAR_420_8 and PLANAR_422_8 formats are supported and treated as 8 bits per element on the Y plane and 16 bits per element on the UV plane (if **Interleave Chroma** is enabled) or 8 bits per element on the U and V planes (if **Interleave Chroma** is disabled.

	17:7	**Reserved** Format: MBZ
	6:0	**Surface Memory Object Control State** Default Value: 0h DefaultVaueDesc Format: **MEMORY_OBJECT_CONTROL_STATE** This 7-bit field is used in various state commands and indirect state objects to define cacheability and other attributes related to memory objects.
6	31:0	**Surface Base Address** Format: GraphicsAddress[31:0] Specifies the low 32 bits of the byte-aligned base address of the surface.

Programming Notes
For SURFTYPE_BUFFER render targets, this field specifies the base address of first element of the surface. The surface is interpreted as a simple array of that single element type. The address must be naturally-aligned to the element size (e.g., a buffer containing R32G32B32A32_FLOAT elements must be 16-byte aligned).For SURFTYPE_BUFFER non-rendertarget surfaces, this field specifies the base address of the first element of the surface, computed in software by adding the surface base address to the byte offset of the element in the buffer.Mipmapped, cube and

MEDIA_SURFACE_STATE

		3D sampling engine surfaces are stored in a 'monolithic' (fixed) format, and only require a single address for the base texture.Linear render target surface base addresses must be element-size aligned, for non-YUV surface formats, or a multiple of 2 element-sizes for YUV surface formats. Other linear surfaces have no alignment requirements (byte alignment is sufficient.)Linear depth buffer surface base addresses must be 64-byte aligned. Note that while render targets (color) can be SURFTYPE_BUFFER, depth buffers cannot.Tiled surface base addresses must be 4KB-aligned. Note that only the offsets from Surface Base Address are tiled, Surface Base Address itself is not transformed using the tiling algorithm.For tiled surfaces, the actual start of the surface can be offset from the Surface Base Address by the X Offset and Y Offset fields.Certain message types used to access surfaces have more stringent alignment requirements. Please refer to the specific message documentation for additional restrictions.
7	31:16	**Reserved** Format: MBZ
	15:0	**Surface Base Address High** Format: GraphicsAddress[47:32] Specifies the high 16 bits of the byte-aligned base address of the surface. Refer to Surface Base Address [31:0] for programming notes applying to this field.

MEMORY_OBJECT_CONTROL_STATE

MEMORY_OBJECT_CONTROL_STATE		
Source:	BSpec	
Size (in bits):	7	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	6:1	**Index to MOCS Tables** The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers. The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime.
	0	**Reserved**

MemoryAddressAttributes

MemoryAddressAttributes

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface. It defines the 32-bit memory address attributes for the third DWord of the HCP command buffer address.

DWord	Bit	Description
0	31:15	**Reserved** Format: MBZ
	14:13	**Base Address - Tiled Resource Mode** Format: U2 **For Media Surfaces:** This field specifies the tiled resource mode. Value / Name / Description: 00b / TRMODE_NONE / TileY resources 01b / TRMODE_TILEYF / 4KB tiled resources 10b / TRMODE_TILEYS / 64KB tiled resources 11b / Reserved /
	12	**Base Address - Row Store Scratch Buffer Cache Select** Format: U1 This field controls if the Row Store is going to store inside Media Cache (rowstore cache) or to LLC. Value / Name / Description: 0 / / Buffer going to LLC. 1 / / Buffer going to Internal Media Storage.
	11	**Reserved** Format: MBZ
	10	**Base Address - Memory Compression Mode** Format: U1 Distinguishes vertical from horizontal compression. Please refer to vol1a **Memory Data Formats chapter - section** media Memory Compression for more details. Value / Name: 0b / Horizontal Compression Mode **Programming Notes** Must be zero; vertical compression is not supported.

MemoryAddressAttributes		
	9	**Base Address - Memory Compression Enable** Format: Enable Memory compression will be attempted for this surface.
	8:7	**Base Address - Arbitration Priority Control** Format: HEVC_ARBITRATION_PRIORITY
	6:1	**Base Address - Index to Memory Object Control State (MOCS) Tables** Format: U6 The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers. The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime.
	0	**Reserved**

Merged Media Block Message Header

MH_MBM - Merged Media Block Message Header

Source: DataPort 1

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**X Offset** Format: S31 X offset (in bytes) of the upper left corner of the block into the surface.
1	31:0	**Y Offset** Format: S31 Y offset (in rows) of the upper left corner of the block into the surface.
2	31:0	**Merged Media Block Message Control** Format: MHC_MBM_CONTROL Specifies the Merged message subtype and additional input parameters.
3	31:0	**Mask** Format: U32 The Mask is ignored by the Merged Media Block message: all Dwords are always returned on reads, and always enabled to be written on writes.
4	31:0	**FFTID** Format: MHC_FFTID Fixed Function Thread ID
5..7	95:0	**Reserved** Format: Ignore Ignored

Merged Media Block Message Header Control

MHC_MBM_CONTROL - Merged Media Block Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:30	**Message Mode** Format: Enumeration Specifies the Media Block Read message is Normal subtype. Value / Name / Description: 00h / Normal / The Block Height and Block Width fields are specified in this Dword. The Mask is ignofed by a media block read message. Others / Reserved / Reserved.
	29	**Reserved** Format: Ignore Ignored
	28:24	**Sub-Register Offset** Format: U5 Provides the sub-register offset in unit of bytes of a Merged Media Block Read message. This field is ignored (reserved) for a media block write message. Range = [0, 28]. Only a multiple of BasePitch, including 0, is valid. **Programming Notes** Sub-Register Offset and Register Pitch Control allow software to assembly multiple media block reads directly into a shared GRF register set. For example, if both are set to zero, the read data are written to GRF registers, aligning to the least significant bits of the first register, and the register pitch is equal to the next power-of-2 that is greater than or equal to the Block Width. If Register Pitch Control is non-zero, multiple media block read messages sharing the same Register Pitch Control but with different Sub-Register Offset can fill in the same set of GRF registers with media block data line interleaved. **Restriction** Restriction : For the Sampler Cache Data, this field must be zero. Restriction : BasePitch is defined as the next the power-of-2 that is greater than or equal to the Block Width. Minimum BasePitch is 1 DWord. Sub-Register Offset must be aligned to BasePitch (therefore will be a multiple of DWords as well). When Register Pitch Control = 0, Sub-Register Offset must align to BasePitch*Block

MHC_MBM_CONTROL - Merged Media Block Message Header Control

		Height. ensuring the output fits in a single GRF register. In general (and specifically when Sub-Register Offset is greater than 0), when the resulting data will cross a GRF register boundary, the data must be placed symmetrically between GRF registers.
	23:22	**Reserved** Format: Ignore Ignored
	21:16	**Block Height** Format: U6 Height in rows of block being accessed. Range = [0,63] representing 1 to 64 rows **Restriction** Restriction : If Block Width (bytes), then Maximum Block Height (rows) is constrained by (# Dwords width) * (# rows) <= 64 Dwords.
	15:10	**Reserved** Format: Ignore Ignored
	9:8	**Register Pitch Control** Format: U2 Controls the register pitch for a Merged Media Block Read message. This field is ignored (reserved) for a media block write message. Register Pitch Control is only allowed to be non-zero when Block Width is a multiple of DWords. Restriction : Register Pitch Control must be zero when SLICE_COMMON_ECO_CHICKEN1::DisableMediaMessageFix is set. Restriction : For the Sampler Cache Data, this field must be zero.

Value	Name	Description
0h	RPC_1 **[Default]**	1 Block
1h	RPC_2	2 Blocks
3h	RPC_4	4 Blocks

Restriction

Restriction :
BasePitch is defined as the next the power-of-2 that is greater than or equal to the Block Width. The effective register pitch (RPC*BasePitch)+SRO must be less than or equal to 32 bytes (to fit in a single GRF register).

MHC_MBM_CONTROL - Merged Media Block Message Header Control		
	7:6	**Reserved** Format: Ignore Ignored
	5:0	**Block Width** Format: U6 Width in bytes of the block being accessed. Range = [0,31] representing 1 to 32 Bytes.

Message Descriptor - Render Target Write

Message Descriptor - Render Target Write

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31	**Reserved** Format: MBZ
	30	**Data Format** Format: U1 Value / Name / Description: 0 – Single Precision – 32b 1 – Half Precision – 16b **Programming Notes** This field is applicable for Render Target Write Messages ONLY.
	29:14	**Reserved** Format: MBZ
	13	**Per-Sample PS outputs enable** This bit must not be set when Render Target is not bound to pixel-shader OR when Render Target is not multisampled. This bit must be set when PS runs at sample-frequency i.e. pixel shader dispatch mode is PER_SAMPLE. By setting this bit, PS sends Render Target Write Message that outputs color, depth(optional) and stencil(optional) phases on per sample basis for each slot. When Render Target is multisampled and this bit is reset, Render Target outputs color, depth(optional) and stencil(optional) at pixel frequency. It should be noted that the latter case is applicable for only per-pixel PS invocation.
	12	**Last Render Target Select** This bit must be set on the last render target write message sent for each group of pixels. For single render target pixel shaders, this bit is set on all render target write messages. For multiple render target pixel shaders, this bit is set only on messages sent to the last render target. This bit must be zero for SIMD8 Image Write message. **Programming Notes** In general, when threads are not launched by 3D FF, this bit must be zero.
	11	**Slot Group Select** This field selects whether slots 15:0 or slots 31:16 are used for bypassed data. Bypassed data includes the antialias alpha, multisample coverage mask, and if the header is not present also includes the X/Y addresses and pixel enables. For 8- and 16-pixel dispatches, SLOTGRP_LO must be selected on every message. For 32-pixel dispatches, this field must be set

Message Descriptor - Render Target Write

correctly for each message based on which slots are currently being processed.

Value	Name	Description
0	SLOTGRP_LO	choose bypassed data for slots 15:0
1	SLOTGRP_HI	choose bypassed data for slots 31:16

Programming Notes
For SIMD8 Image Write message thsi field MBZ.

10:8 **Message Type**

This field specifies the type of render target message.

For the SIMD8_DUALSRC_xx messages, the low bit indicates which slots to use for the pixel enables, X/Y addresses, and oMask.

Value	Name	Description
000b	SIMD16	SIMD16 single source message
001b	SIMD16_REPDATA	SIMD16 single source message with replicated data
010b	SIMD8_DUALSRC_LO	SIMD8 dual source message, use slots 7:0
011b	SIMD8_DUALSRC_HI	SIMD8 dual source message, use slots 15:8
100b	SIMD8_LO	SIMD8 single source message, use slots 7:0
111b	SIMD16_REPDATA_TM	It's only supported when accessing *Tiled Memory*. Using this Message Type to access linear *(Untiled)* memory is UNDEFINED.

Programming Notes
the above slots indicated are within the 16 slots selected by **Slot Group Select**. If SLOTGRP_HI is selected, the SIMD8 message types above reference slots 23:16 or 31:24 instead of 7:0 or 15:8, respectively.
SIMD16_REPDATA message must not be used in SIMD8 pixel-shaders.

7:0 **Reserved**

Format:	MBZ

Message Descriptor - Sampling Engine

Message Descriptor - Sampling Engine

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31	**EOT**
	30	**Return Format** Format: U1 Value / Name / Description: 0 / 32-bit / Return data is 32b 1 / 16-bit / Return data is 16b **Programming Notes** This field must be set to 32-bit for messages with SIMD Mode of SIMD4x2 or SIMD32/64. This field must be set to 32 for resinfo, LOD and sampleinfo messages. This message must be set to 32-bit for ld_mcs
	29	**Reserved** Format: MBZ
	28:25	**Message Length** Format: U4 This field specifies the number of 256-bit GRF registers starting from (src) to be sent out on the request message payload. Value / Name: [1,15] **Programming Notes** A value of 0 is considered erroneous.
	24:20	**Response Length** Format: U5 This field indicates the number of 256-bit registers expected in the message response. Value / Name: [0,16] **Programming Notes** A value 0 indicates that the request message does not expect any response. The largest

Message Descriptor - Sampling Engine

		response supported is 16 GRF registers.
	19	**Header Present** Format: Enable **Description** Specifies whether the message includes a header phase. If the header is not present (this field is zero), all of the fields normally contained in the header are assumed to be 0. If the header is not present, in some cases the **Write Channel Mask** fields are set according to the Response Length. For more details, please refer to the **Payload Parameter Definition**section, under *vol5c Shared Functions* .
	18:17	**SIMD Mode[1:0]** Format: U2 Specifies the SIMD mode of the message being sent. **Programming Notes** The SIMD Mode Extension field in the message header distinguishes between SIMD8D and SIMD4x2 modes.
	16:12	**Message Type** Format: U5 Specifies the type of message being sent. For more details, please refer to **Message Format** section for the definition of these 5 bits..
	11:8	**Sampler Index** Format: U4 Specifies the index into the sampler state table. Ignored for ld, resinfo, sampleinfo, and cache_flush type messages. **Value** / **Name**: [0,15] **Programming Notes** • For the deinterlace message, this field must be a multiple of 2 (even). • For the sample_8x8 message, this field must be a multiple of 4.
	7:0	**Binding Table Index** Format: U8 Specifies the index into the **binding table**. Ignored for cache_flush type messages. Values of 255 and 253 indicate stateless. 254 indicates SLM. 252 indicates bindless. **Value** / **Name**: [0,255]

MFD_MPEG2_BSD_OBJECT Inline Data Description

MFD_MPEG2_BSD_OBJECT Inline Data Description

Source: VideoCS
Size (in bits): 64
Default Value: 0x00000000, 0x00000000

DW0..1 corresponds to DW3..4 of the MFD_MPEG2_BSD_OBJECT.

DWord	Bit	Description
0	31:24	**Slice Horizontal Position** Format: U8 in Macroblocks This field indicates the horizontal position of the first macroblock in the slice.
	23:16	**Slice Vertical Position** Format: U8 in Macroblocks This field indicates the vertical position of the first macroblock in the slice.
	15:8	**Macroblock Count** Format: U8 in Macroblocks This field indicates the number of macroblocks in the slice, including skipped macroblocks.
	7	**Slice Concealment Override Bit** This bit forces hardware to handle the current slice in Conceal or Deocde Mode. If this bit is set to one, VIN will force the current slice to do concealment or to decode from bitstream regardless if the slice boundary has errors or not. Value / Name / Description: 1h — VIN will use driver-provided "Slice Concealment Type" regardless of valid slice boundary 0h — Driver must program "Slice Concealment Type" to '0'. VIN will set "Slice Concealment Type" depending if the slice boundary has error or not
	6	**Slice Concealment Type Bit** This bit can be forced by driver ("Slice Concealment Override Bit") or set by VINunit depending on slice boundary errors. Value / Name / Description: 1h — VMD will conceal all MBs of the slice regardless of bitstream. (If driver does not force the value of this bit, VIN will set this bit depending on slice boundary error. If the next slice position of the current slice is out-of-bound or the same or earlier than the current slice start position, VIN will set this bit for the next slice) 0h — VMD will decode MBs from the bitstream until the bitstream is run-out. Then VMD will conceal the remaining MBs. **Programming Notes** VIN can turn this bit from 0 to 1 internally if "Slice Concealment Disable Bit" is "0" and VIN detects slice boundary errors.

MFD_MPEG2_BSD_OBJECT Inline Data Description

	5	**Last Pic Slice** This bit is added to support error concealment at the end of a picture. **Value** / **Name** / **Description** 1h / / The current Slice is the last Slice of the entire picture 0h / / The current Slice is not the last Slice of current picture
	4	**Reserved**
	3	**Is Last MB** **Value** / **Name** / **Description** 1h / / The current MB is the last MB in the current Slice 0h / / The current MB is not the last MB in the current Slice
	2:0	**First Macroblock Bit Offset** Format: U3 This field provides the bit offset of the first macroblock in the first byte of the input bitstream.
1	31:29	**Reserved** Format: MBZ
	28:24	**Quantizer Scale Code** Format: U5 This field sets the quantizer scale code of the inverse quantizer. It remains in effect until changed by a decoded quantizer scale code in a macroblock. This field is decoded from the slice header by host software.
	23:17	**Reserved** Format: MBZ
	16:8	**Next Slice Vertical Position** Format: U9 in macroblocks This field indicates the vertical position (in macroblock units) of the first macroblock in the next slice. **Programming Notes** This field is primarily used for error concealment. In the case that current slice is the last slice, this field should set to the height of the picture (field picture will be in height of field) (since y-direction is zero-based numbering).
	7:0	**Next Slice Horizontal Position** Format: U8 in macroblocks This field indicates the horizontal position (in macroblock units) of the first macroblock in the next slice. **Programming Notes** This field is primarily used for error concealment. In the case that current slice is the last slice, this field should set 0.

MPEG2

49	31:0	**hw_263_num_rows_in_gob** Refer to Table 6-29 in the MPEG4-2 standard specification, vop_height/(16*num_gobs_in_vop) (short header format only)

MSAA Sample Number Message Address Control

MACD_MSAA_SN - MSAA Sample Number Message Address Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:4	**Reserved** Format: MBZ Ignored
	3:0	**Sample Number** Format: U4 Specifies the sample number for the slot. If the sample number is larger than the **Number of Multisamples** in the Surface State, then the access is out of bounds.

MsgDescpt31

MsgDescpt31

Source: Eulsa
Size (in bits): 29
Default Value: 0x00000000

DWord	Bit	Description
0	28:25	**Message Length** This field specifies the number of 256-bit MRF registers starting from <curr_dest> to be sent out on the request message payload. Valid value ranges from 1 to 15. A value of 0 is considered erroneous. Value: 1-15 — Name: Number of MRF Registers
	24:20	**Response Length** This field indicates the number of 256-bit registers expected in the message response. The valid value ranges from 0 to 16. A value 0 indicates that the request message does not expect any response. The largest response supported is 16 GRF registers. Value: 0-16 — Name: Number of Registers
	19	**Header Present** Format: Enable If set, indicates that the message includes a header. Depending on the target shared function, this field may be restricted to either enabled or disabled. Refer to the specific shared function section for details.
	18:0	**Function Control** This field is intended to control the target function unit. Refer to the section on the specific target function unit for details on the contents of this field.

Normal Media Block Message Header

MH_MB - Normal Media Block Message Header

Source: DataPort 1

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**X Offset** Format: S31 X offset (in bytes) of the upper left corner of the block into the surface. **Programming Notes** Must be DWord aligned (Bits 1:0 MBZ) for the write form of the message.
1	31:0	**Y Offset** Format: S31 Y offset (in rows) of the upper left corner of the block into the surface.
2	31:0	**Normal Media Block Message Control** Format: MHC_MB_CONTROL Specifies the Normal message subtype and additional input parameters.
3	31:0	**Mask** Format: U32 The Mask is ignored by the Normal Media Block message: all Dwords are always returned on reads, and always enabled to be written on writes.
4	31:0	**FFTID** Format: MHC_FFTID Fixed Function Thread ID
5..7	95:0	**Reserved** Format: Ignore Ignored

Normal Media Block Message Header Control

MHC_MB_CONTROL - Normal Media Block Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:30	**Message Mode** Format: Enumeration Specifies the interpretation of M0.3 (Pixel or Byte Mask). For the Sampler Cache Data Port, this field is ignored, behaving as if always set to NORMAL. **Value / Name / Description** 00h / Normal / The Block Height and Block Width fields are specified in this Dword. The Mask is ignored by a media block read message and behaves as if it is set to all ones for a media block write message. Others / Reserved / Reserved. **Programming Notes** The Media Block Read message is Normal subtype when both Sub-Register Offset and Register Pitch Control are zero. The Media Block Read message is Merged subtype when either Sub-Register Offset or Register Pitch Control are non-zero.
	29	**Reserved** Format: Ignore Ignored
	28:24	**Sub-Register Offset** Format: MBZ The sub-register offset must be 0 for Normal Media Block Read message subtype. This field is ignored (reserved) for a media block write message.
	23:22	**Reserved** Format: Ignore Ignored

MHC_MB_CONTROL - Normal Media Block Message Header Control

	21:16	**Block Height** Format: U6 Height in rows of block being accessed. Range = [0,63] representing 1 to 64 rows **Restriction** Restriction : If Block Width (bytes), then Maximum Block Height (rows) is constrained by (# Dwords width) * (# rows) <= 64 Dwords.
	15:10	**Reserved** Format: Ignore Ignored
	9:8	**Register Pitch Control** Format: MBZ The register pitch must be 0 for a Normal Media Block Read message. This field is ignored (reserved) for a media block write message.
	7:6	**Reserved** Format: Ignore Ignored
	5:0	**Block Width** Format: U6 Width in bytes of the block being accessed. For normal Media Block Writes, Range = [0,63] representing 1 to 64 Bytes. For normal Media Block Reads and for masked and merged Media Block messages, Range = [0,31] representing 1 to 32 Bytes. **Programming Notes** Must be DWord aligned for the write form of the message.

oMask Message Data Payload Register

MDPR_OMASK - oMask Message Data Payload Register

Source: BSpec
Size (in bits): 256
Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:16	**oMask1** Format: U16 oMask for Pixels [15:0] of Slot 1. Not used for Slot Group HI.
	15:0	**oMask0** Format: U16 oMask for Pixels [15:0] of Slot 0. Not used for Slot Group HI.
1	31:16	**oMask3** Format: U16 oMask for Pixels [15:0] of Slot 3. Not used for Slot Group HI.
	15:0	**oMask2** Format: U16 oMask for Pixels [15:0] of Slot 2. Not used for Slot Group HI.
2	31:16	**oMask5** Format: U16 oMask for Pixels [15:0] of Slot 5. Not used for Slot Group HI.
	15:0	**oMask4** Format: U16 oMask for Pixels [15:0] of Slot 4. Not used for Slot Group HI.
3	31:16	**oMask7** Format: U16 oMask for Pixels [15:0] of Slot 7. Not used for Slot Group HI.
	15:0	**oMask6** Format: U16 oMask for Pixels [15:0] of Slot 6. Not used for Slot Group HI.

MDPR_OMASK - oMask Message Data Payload Register		
4	31:16	**oMask9** Format: U16 oMask for Pixels [15:0] of Slot 9. Used only if Slot Group HI or SIMD16.
	15:0	**oMask8** Format: U16 oMask for Pixels [15:0] of Slot 8. Used only if Slot Group HI or SIMD16.
5	31:16	**oMask11** Format: U16 oMask for Pixels [15:0] of Slot 11. Used only if Slot Group HI or SIMD16.
	15:0	**oMask10** Format: U16 oMask for Pixels [15:0] of Slot 10. Used only if Slot Group HI or SIMD16.
6	31:16	**oMask13** Format: U16 oMask for Pixels [15:0] of Slot 13. Used only if Slot Group HI or SIMD16.
	15:0	**oMask12** Format: U16 oMask for Pixels [15:0] of Slot 12. Used only if Slot Group HI or SIMD16.
7	31:16	**oMask15** Format: U16 oMask for Pixels [15:0] of Slot 15. Used only if Slot Group HI or SIMD16.
	15:0	**oMask14** Format: U16 oMask for Pixels [15:0] of Slot 14. Used only if Slot Group HI or SIMD16.

Per Thread Scratch Space Message Header Control

MHC_PTSS - Per Thread Scratch Space Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:4	**Reserved** Format: Ignore Ignored
	3:0	**Per Thread Scratch Space** Format: U4 Specifies the amount of scratch space allowed to be used by this thread for messages in which the Binding Table Index is Stateless model, otherwise this field is ignored.The data port will use this to bounds check scratch space messages. Value range = [0,11] represents [1KB, 2MB] in powers of two. **Programming Notes** Writes out of bounds will be ignored. Reads out of bounds will return 0.

PIXEL_HASH_TABLE_1BIT_32ENTRY

PIXEL_HASH_TABLE_1BIT_32ENTRY

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

Description
2-way pixel hashing table. Table is 32-entries:8X,4Y in [Y][X] format. Each entry is a single bit that indicates which sub-slice hardware block the indicated xy pixel block is mapped.
pixelhash_id maps to subslice. A value of 0 indicates the first enabled subslice. A value of 1 indicates the second enabled subslice.

DWord	Bit	Description
0	31:24	**Pixel Hashing Table Entries y[3]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=3 and x=7..0
	23:16	**Pixel Hashing Table Entries y[2]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=2 and x=7..0
	15:8	**Pixel Hashing Table Entries y[1]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=1 and x=7..0
	7:0	**Pixel Hashing Table Entries y[0]x[7:0]** Format: U8 Indicates the pixelhash_id for the pixel block that has y=0 and x=7..0

PIXEL_HASH_TABLE_1BIT_64ENTRY

PIXEL_HASH_TABLE_1BIT_64ENTRY	
Source:	BSpec
Size (in bits):	64
Default Value:	0x00000000, 0x00000000

Description
2-way pixel hashing table. Table is 64-entries:8X,8Y in [Y][X] format. Each entry is a single bit that indicates which sub-slice hardware block the indicated xy pixel block is mapped.
pixelhash_id maps to subslice. A value of 0 indicates the first enabled subslice. A value of 1 indicates the second enabled subslice.

PIXEL_HASH_TABLE_2BIT_128ENTRY

PIXEL_HASH_TABLE_2BIT_128ENTRY

Source: BSpec

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

Description
3-wayor 4-way pixel hashing table. Table is 128-entries:8X,8Y in [Y][X] format. Each entry is two bits that indicates which sub-slice hardware block the indicated xy pixel block is mapped.
pixelhash_id maps to subslice. A value of 0 indicates the first enabled subslice. A value of 1 indicates the second enabled subslice.

Pixel Masked Media Block Message Header

MH_MBPM - Pixel Masked Media Block Message Header

Source: DataPort 1

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**X Offset** Format: S31 X offset (in bytes) of the upper left corner of the block into the surface. **Programming Notes** When Message Mode is set to PIXEL_MASK, this field must be a multiple of 32.
1	31:0	**Y Offset** Format: S31 Y offset (in rows) of the upper left corner of the block into the surface. **Programming Notes** When Message Mode is set to PIXEL_MASK, this field must be a multiple of 4.
2	31:0	**Media Block Message Control** Format: MHC_MBPM_CONTROL Specifies the message subtype is Pixel Masked.
3	31:0	**Pixel Mask** Format: U32 Specifies the Pixel Mask for writes when Message Mode field is PIXEL_MASK. **Programming Notes** The Pixel Mask applies to the 2x2 square tiles (UL, UR, LL, LR), which themselves tiled (UL, UR, LL, LR) and then repeated on the right for the remaining 16-bits to cover a 4 row 8 column area.
4	31:0	**FFTID** Format: MHC_FFTID Fixed Function Thread ID
5..7	95:0	**Reserved** Format: Ignore Ignored

Pixel Masked Media Block Message Header Control

MHC_MBPM_CONTROL - Pixel Masked Media Block Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:30	**Message Mode** Format: Enumeration Specifies the Media Block Write Message subtype is Pixel Masked. Value / Name / Description: 01h / PIXEL_MASK / Use the Pixel Mask in the Message Header. The Block Height and Block Width are ignored and behave as if they are set to 4 rows and 32 bytes, respectively. Others / Reserved / Reserved.
	29	**Reserved** Format: Ignore Ignored
	28:24	**Sub-Register Offset** Format: MBZ The sub-register offset must be 0 for Pixel Masked Media Block message subtype.
	23:22	**Reserved** Format: Ignore Ignored
	21:16	**Block Height** Format: U6 This field is ignored (reserved) for a Pixel Masked media block write message.
	15:10	**Reserved** Format: Ignore Ignored
	9:8	**Register Pitch Control** Format: MBZ The register pitch must be 0 for a Pixel Masked Media Block message.

MHC_MBPM_CONTROL - Pixel Masked Media Block Message Header Control

	7:6	**Reserved** Format: Ignore Ignored
	5:0	**Block Width** Format: U6 This field is ignored (reserved) for a Pixel Masked media block write message.

Pixel Sample Mask Message Header Control

MHC_PSM - Pixel Sample Mask Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x0000FFFF

DWord	Bit	Description
0	31:16	**Reserved** Format: Ignore Ignored
	15:0	**Pixel Sample Mask** Default Value: 0FFFFh Default Format: U16 SIMD16 and SIMD8 messages. All 16 bits are used for SIMD16. For untyped SIMD8 messages, the low 8 bits of field are used. If the header is not delivered, this field defaults to all ones. This field is ignored for SIMD4x2 messages.

Pixel Sample Mask Render Target Message Header Control

MHC_RT_PSM - Pixel Sample Mask Render Target Message Header Control

Source:	BSpec
Size (in bits):	32
Default Value:	0x00000000

DWord	Bit	Description
0	31:16	**Dispatched Pixel/Sample Enables** Format: U16 One bit per pixel (or sample within pixel) indicating which pixels/samples were originally enabled when the thread was dispatched. The Dispatched Pixel/Sample Enables must be unmodified from the ones sent when the pixel shader thread was initiated. If the Dispatched Pixel/Sample Enables are modified, behavior is undefined. **Programming Notes** When operating in PER_SAMPLE mode these bits correspond to samples, not pixels. Each subspan slot (4 bits) corresponds to a specific sample location for the subspan. Note that in NUMSAMPLES_1 mode, a pixel and sample are synonomous. When operating in PER_PIXEL mode, this field is ignored, and instead the SampleEnableMask (obtained via bypass) are used to clear the Depth Scoreboard.
	15:0	**Pixel/Sample Enables** Format: U16 Specifies which pixels/samples are still lit based on kill instruction activity in the pixel shader. This mask is AND'd with the Dispatched Pixel/Sample Enables mask, and that is used to control actual accesses to the color buffer. Pixels/samples will be dropped on masked writes, and the GRF is not modified for masked reads. **Programming Notes** When operating in PER_SAMPLE mode these bits correspond to samples, not pixels, as the PS is run per-sample. Each subspan slot (4 bits) corresponds to a specific sample location for the subspan. When operating in PER_PIXEL mode, these bits still correspond to pixels, as the PS is run per-pixel. Each pixel's mask bit is replicated according to Number of Multisamples and combined with other masks to control writes to the multisample locations.

Power Clock State Format

Power Clock State Format

Source: RenderCS
Size (in bits): 31
Default Value: 0x00000088

Known Uses

- R_PWR_CLK_STATE - Render Power Clock State Register
- PM_PWR_CLK_STATE - PM Power Clock State Request (Intended, in GT/GTI space, not yet in use)
- PM_PWR_CLK_STATE (Intended, in GT/GTI space, not yet in use)

DWord	Bit	Description
0	30:20	**Reserved** Access: RO Format: MBZ
	19	**Reserved** Access: RO Format: MBZ
	18	**Enable Slice Count Request** Access: R/W Enable Slice Count Request. Value / Name / Description 0h / Disable / Use async PMunit slice count request. 1h / Enable / Use SliceCount from this register.
	17:15	**Slice Count Request** Access: R/W Slice Count Request. This is limited to the number of slices in a given SKU. Value / Name / Description 001b / / 1 slice. 010b / / 2 slices. 011b / / 3 slices. 100b / / 4 slices. 101b / / 5 slices. Hardware will revert to 4 slices 110b / / 6 slices.

Power Clock State Format

	14:12	**Reserved** Access: RO Format: MBZ
	11:8	**Reserved** Access: RO Format: MBZ
	8	**Reserved** Access: RO
	7:4	**EUmax** Access: R/W Maximum number of EUs to power (per subslice if multiple subslices enabled). To specify an exact number of subslices, set EUmax equal to EUmin.

Value	Name	Description
0010b		2 EUs
0100b		4 EUs
0110b		6 EUs
1000b	**[Default]**	8 EUs

Programming Notes
EUmin and EUmax need to be even and odd numbers are illegal; hardware will clip odd EU counts to an even value.

	3:0	**EUmin** Access: R/W Minimum number of EUs to power (per subslice if multiple subslices enabled). To specify an exact number of subslices, set EUmax equal to EUmin.

Value	Name	Description
0010b		2 EUs
0100b		4 EUs
0110b		6 EUs
1000b	**[Default]**	8 EUs

Programming Notes
EUmin and EUmax need to be even and odd numbers are illegal; hardware will clip odd EU counts to an even value.

DWord	Bit	Description
0..3	31:0	**Reserved**
4	31:0	**Ring Head Pointer Storage**

PPHWSP_LAYOUT - PPHWSP_LAYOUT

		The contents of the Ring Buffer Head Pointer register (register DWord 1) are written to this location either as result of an MI_REPORT_HEAD instruction or as the result of an "automatic report" (see RINGBUF registers).
5..15	31:0	**Reserved**
16	0	**Cumulative Context Run Time** This has the cumulative run time of the context on HW. HW reports CTX_TIMESTAMP to this location on a context switch. This value is written after the context save is complete. The value that is saved in the context image does not include the time between the saving of the cumulative value to context to the time we complete the save. If required for the value to always increment and not take the context save into consideration, driver must look at the value in the context image.
17	31:1	**Reserved**
	0	**Element Switch** Value / Name / Description 0 / / Indicates the context is not submitted as the first element in the execlist. 1 / / Indicates the corresponding context has been submitted as first element of the execlist. Preempt Request Received Timestamp is the time when the pending execlist has been submitted to HW. Note that across multiple submissions a given context could be first or second element of an execlist. This bit will get set if the context has been submitted as the first element in the execlist.
18..19	63:0	**Preempt Request Received Timestamp** TIMESTAMP register sampled on preemption request is reported.
20..21	63:0	**Context Restore Complete Timestamp** TIMESTAMP register sampled on context restore complete is reported.
22..23	63:0	**Context Save Finished Timestamp** TIMESTAMP register sampled on context save completion is reported.
24..27	127:0	**MI_SEMAPHORE_WAIT** MI_SEMAPHORE_WAIT command on which the context got switched out due to semaphore wait. This field is only valid and must be looked at when the context switch reason in context status buffer is stated as "Wait on Semaphore".
28..31	127:0	**Reserved**
32..33	63:0	**Reserved**
34..1020	31:0	**Reserved**

Read-Only Data Port Message Types

MT_DP_RO - Read-Only Data Port Message Types

Source: Read-Only DataPort

Size (in bits): 5

Default Value: 0x00000000

Lists all the Message Types in a Read-Only Data Port Message Descriptor [18:14].
Read operations from the Constant Cache and Sampler Cache are encoded in the Read-Only Data Port.
Many of the operations are also implemented in Data Port 0, and those operations use the same Message Header.

DWord	Bit	Description
0	4	**Reserved** Format: MBZ Ignored
	3:0	**Message Type** Format: Enumeration Specifies type of message

Value	Name	Description
00h	MT_CC_OWB **[Default]**	Oword Block Read Constant Cache message
01h	MT_CC_OWUB	Unaligned Oword Block Read Constant Cache message
02h	MT_CC_OWDB	Oword Dual Block Read Constant Cache message
03h	MT_CC_DWS	Dword Scattered Read Constant Cache message
04h	MT_SC_OWUB	Unaligned Oword Block Read Sampler Cache message
05h	MT_SC_MB	Media Block Read Sampler Cache message
06h	MT_RSI	Read Surface Info message
Others	Reserved	Ignored

Read Surface Info 32-Bit Address Payload

MAP32B_RSI - Read Surface Info 32-Bit Address Payload

Exists If:	//[MessageType] != 'Sample_8x8'
Size (in bits):	512
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

This is the normal surface state used by all messages that use SURFACE_STATE except those that use MEDIA_SURFACE_STATE.

DWord	Bit	Description
0	31:29	**Surface Type** This field defines the type of the surface.

Value	Name	Description
0h	SURFTYPE_1D	Defines a 1-dimensional map or array of maps
1h	SURFTYPE_2D	Defines a 2-dimensional map or array of maps
2h	SURFTYPE_3D	Defines a 3-dimensional (volumetric) map
3h	SURFTYPE_CUBE	Defines a cube map or array of cube maps
4h	SURFTYPE_BUFFER	Defines an element in a buffer
5h	SURFTYPE_STRBUF	Defines a structured buffer surface
6h	Reserved	
7h	SURFTYPE_NULL	Defines a null surface

Programming Notes

A null surface is used in instances where an actual surface is not bound. When a write message is generated to a null surface, no actual surface is written to. When a read message (including any sampling engine message) is generated to a null surface, the result is all zeros. Note that a null surface type is allowed to be used with all messages, even if it is not specificially indicated as supported. All of the remaining fields in surface state are ignored for null surfaces, with the following exceptions:

- **Width, Height, Depth, LOD,** and **Render Target View Extent** fields must match the depth buffer's corresponding state for all render target surfaces, including null.

All sampling engine and data port messages support null surfaces with the above behavior, even if not mentioned as specifically supported, except for the following:

- The **Surface Type** of a surface used as a render target (accessed via the Data Port's Render Target Write message) must be the same as the **Surface Type** of all other render targets and of the depth buffer (defined in 3DSTATE_DEPTH_BUFFER), unless either the depth buffer or render targets are SURFTYPE_NULL.

RENDER_SURFACE_STATE

	28	**Surface Array** Format: Enable This field, if enabled, indicates that the surface is an array. **Programming Notes** If this field is *enabled*, the **Surface Type** must be SURFTYPE_1D, SURFTYPE_2D, or SURFTYPE_CUBE. If this field is *disabled* and **Surface Type** is SURFTYPE_1D, SURFTYPE_2D, or SURFTYPE_CUBE, the **Depth** field must be set to zero.
	27	**ASTC_Enable** Format: Enable This field, if enabled, indicates that the surface is one of ASTC compression formats. **Programming Notes** If this field is *enabled*, the definition of **Surface Format** encoding will follow a new convention defined by ASTC. If this field is *disabled*, the definition of **Surface Format** will follow the legacy convention defined in non-ASTC style.
	26:18	**Surface Format** Format: SURFACE_FORMAT **Description** This field specifies the format of the surface or element within this surface. This field is ignored for all data port messages other than the render target message and streamed vertex buffer write message. Some forms of the media block messages use the surface format. If **ASTC_Enable** is set to 0, the supported formats and their encoding is listed in the table (x) in Section (y); Otherwise the supported formats and their encoding is listed in the table (x+1) in Section (y). **Programming Notes** If **ASTC_Enable** is set to 0: YUV (YCRCB) surfaces used as render targets can only be rendered to using 3DPRIM_RECTLIST with even X coordinates on all of its vertices, and the pixel shader cannot kill pixels. If **Number of Multisamples** is set to a value other than MULTISAMPLECOUNT_1, this field cannot be set to the following formats: • Any compressed texture format (BC*, DXT*, FXT*, ETC*, EAC*) • Any YCRCB* format This field cannot ASTC format if the **Surface Type** is SURFTYPE_BUFFER or SURFTYPE_STRBUF This field cannot be ASTC format if the **Surface Type** is SURFTYPE_1D. This field cannot be a YUV (YCRCB*) or compressed (BC*, DXT*, FXT*, ETC*, EAC*) format if the **Surface Type** is SURFTYPE_BUFFER or SURFTYPE_STRBUF This field cannot be a planar YUV (PLANAR_*) or compressed (BC*, DXT*, FXT*, ETC*, EAC*) format if the **Surface Type** is SURFTYPE_1D.

RENDER_SURFACE_STATE

17:16 **Surface Vertical Alignment**

Description
For Sampling Engine and Render Target Surfaces: This field specifies the vertical alignment requirement in elements for the surface. Refer to the "Memory Data Formats" chapter for details on how this field changes the layout of the surface in memory. An *element* is defined as a pixel in uncompresed surface formats, and as a compression block in compressed surface formats. For MSFMT_DEPTH_STENCIL type multisampled surfaces, an element is a sample.
This field is used for 2D, CUBE, and 3D surface alignment when Tiled Resource Mode is TRMODE_NONE (Tiled Resource Mode is disabled). This field is ignored for 1D surfaces and also when Tiled Resource Mode is not TRMODE_NONE (e.g. Tiled Resource Mode is enabled). See the appropriate Alignment table in the "Surface Layout and Tiling" section under Common Surface Formats for the table of alignment values for Tiled Resrouces.
For other surfaces: This field is ignored.

Value	Name	Description
0h	Reserved	Reserved
1h	VALIGN 4	Vertical alignment factor j = 4
2h	VALIGN 8	Vertical alignment factor j = 8
3h	VALIGN 16	Vertical alignment factor j = 16

Programming Notes
This field is intended to be set to VALIGN_4 if the surface was rendered as a depth buffer, for a multisampled (4x) render target, or for a multisampled (8x) render target, since these surfaces support only alignment of 4. Use of VALIGN_4 for other surfaces is supported, but increases memory usage.
This field is intended to be set to VALIGN_8 only if the surface was rendered as a stencil buffer, since stencil buffer surfaces support only alignment of 8. If set to VALIGN_8, Surface Format must be R8_UINT.
For uncompressed surfaces, the units of "j" are rows of pixels on the physical surface. For compressed texture formats, the units of "j" are in compression blocks, thus each increment in "j" is equal to h pixels, where h is the height of the compression block in pixels.

15:14 **Surface Horizontal Alignment**

Description
For Sampling Engine and Render Target Surfaces: This field specifies the horizontal alignment requirement for the surface.
This field is used for alignment when LOD >= Mip Tail Start LOD This field is ignored when Tiled Resource Mode is not TRMODE_NONE (i.e. Tiled Resources are enabled). See the "Surface Layout and Tiling" section under Common Surface Formats for the table of alignment values for Tile Resrouces.

RENDER_SURFACE_STATE

For other surfaces:
This field is ignored.

Value	Name	Description
0h	Reserved	Reserved
1h	HALIGN 4	Horizontal alignment factor j = 4
2h	HALIGN 8	Horizontal alignment factor j = 8
3h	HALIGN 16	Horizontal alignment factor j = 16

Programming Notes

This field is intended to be set to HALIGN_8 only if the surface was rendered as a depth buffer with Z16 format or a stencil buffer. In this case it must be set to HALIGN_8 since these surfaces support only alignment of 8. For Z32 formats it must be set ot HALIGN_4. Use of HALIGN_8 for other surfaces is supported, but increases memory usage.
For uncompressed surfaces, the units of "i" are pixels on the physical surface. For compressed texture formats, the units of "i" are in compression blocks, thus each increment in "i" is equal to w pixels, where w is the width of the compression block in pixels.

When Auxiliary Surface Mode is set to AUX_CCS_D or AUX_CCS_E, HALIGN 16 must be used.

13:12 **Tile Mode**
This field specifies the type of memory tiling (Linear, WMajor, XMajor, or YMajor) employed to tile this surface. See *Memory Interface Functions* for details on memory tiling and restrictions.

Value	Name	Description
0h	LINEAR	Linear mode (no tiling)
1h	WMAJOR	W major tiling
2h	XMAJOR	X major tiling
3h	YMAJOR	Y major tiling

Programming Notes

- Refer to *Memory Data Formats* for restrictions on *TileMode* direction for the various buffer types. (Of particular interest is the fact that YMAJOR tiling is not supported for display/overlay buffers).
- The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this field.
- Use of WMAJOR is valid only for sampling engine, Data Cache Data Port and render target surfaces and **Surface Format** must be R8_UINT. Vertical Line Stride must be zero. In addition to W tiling, this mode implies that the surface is stored as a stencil buffer. Refer to *Memory Data Formats* section for details on stencil buffer surface layout.
- Linear surfaces can be mapped to Main Memory (uncached) or System Memory (cacheable, snooped). Tiled (X/Y/W) surfaces can only be mapped to Main Memory.
- If **Surface Type** is SURFTYPE_BUFFER, this field must be TILEMODE_LINEAR

RENDER_SURFACE_STATE

- If **Number of Multisamples** is not MULTISAMPLECOUNT_1, this field must be YMAJOR.

If **Surface Type** is SURFTYPE_STRBUF, this field must be TILEMODE_LINEAR.

If **Surface Type** is SURFTYPE_1D this field must be TILEMODE_LINEAR, unless **Sampler Legacy 1D Map Layout Disable** is set to 0, in which case TILEMODE_YMAJOR and TILEMODE_WMAJOR are also allowed. **Tiled Resource Mode** must be set to TRMODE_NONE for these cases.

TILEMODE_XMAJOR is only allowed if Surface Type is SURFTYPE_2D.

If **Surface Format** is ASTC*, this field must be TILEMODE_YMAJOR.

11 **Vertical Line Stride**

Format:	U1 In lines to skip between logically adjacent lines

For 2D Non-Array Surfaces accessed via the Sampling Engine or Data Cache Data Port: Specifies number of lines (0 or 1) to skip between logically adjacent lines - provides support of interleaved (field) surfaces as textures.
For Other Surfaces: Vertical Line Stride must be zero.

Programming Notes

This bit must not be set if the surface format is a compressed type (BCn*, FXT1, ETC*, EAC*).

This bit must not be set if the surface format is compressed type ASTC*.

This bit must not be set if the **Auxiliary Surface Mode** is not AUX_NONE.

If this bit is set on a sampling engine surface, the mip mode filter must be set to MIPFILTER_NONE and the min and mag mode filter cannot be set to MAPFILTER_FLEXIBLE.

10 **Vertical Line Stride Offset**

Format:	U1 In lines of initial offset (when Vertical Line Stride == 1)

For 2D Non-Array Surfaces accessed via the Sampling Engine or Data Cache Data Port: Specifies the offset of the initial line from the beginning of the buffer. Ignored when Vertical **Line Stride** is 0.
For Other Surfaces:
Vertical Line Stride Offset must be zero.

9 **Sampler L2 out of order mode Disable**

Format:	Disable

If disabled this will forced formats which would have bypassed the L2 and been filled into the L1 out of order to be cached in the L2 and send in order to the L1. In general that is any format which is expaned 1:2 in L1 or not expanded at all. This would include all lossless compressed cases
For all other formats this will have no affect.

8 **Render Cache Read Write Mode**
For Surfaces accessed via the Data Port to Render Cache:
This field specifies the way Render Cache treats a write request. If unset, Render Cache allocates a write-only cache line for a write miss. If set, Render Cache allocates a read-write cache line for a

RENDER_SURFACE_STATE

write miss.

For Surfaces accessed via the Sampling Engine or Data Port to Texture Cache or Data Cache:

This field is reserved : MBZ

Value	Name	Description
0h	Write-Only Cache	Allocating write-only cache for a write miss
1h	Read-Write Cache	Allocating read-write cache for a write miss

Programming Notes
This field is provided for performance optimization for Render Cache read/write accesses (from Gen4 EU's point of view).

7:6 **Media Boundary Pixel Mode**

For 2D Non-Array Surfaces accessed via the Data Port Media Block Read Message or Data Port Transpose Read message:

This field enables control of which rows are returned on vertical out-of-bounds reads using the Data Port Media Block Read Message or Data Port Transpose Read message. In the description below, frame mode refers to **Vertical Line Stride** = 0, field mode is **Vertical Line Stride** = 1 in which only the even or odd rows are addressable. The frame refers to the entire surface, while the field refers only to the even or odd rows within the surface.

For Other Surfaces:

Reserved : MBZ

Value	Name	Description
0h	NORMAL_MODE	The row returned on an out-of-bound access is the closest row in the frame or field. Rows from the opposite field are never returned.
1h	Reserved	
2h	PROGRESSIVE_FRAME	The row returned on an out-of-bound access is the closest row in the frame, even if in field mode.
3h	INTERLACED_FRAME	In field mode, the row returned on an out-of-bound access is the closest row in the field. In frame mode, even out-of-bound rows return the nearest even row while odd out-of-bound rows return the nearest odd row.

5 **Cube Face Enable - Negative X**

Exists If:	[Surface Type] == 'SURFTYPE_CUBE'
Format:	Enable

For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine:

This field enable the individual face of a cube map. Enabling a face indicates that the face is present in the cube map, while disabling it indicates that that face is represented by the texture map's border color. Refer to Memory Data Formats for the correlation between faces and the cube map memory layout. Note that storage for disabled faces must be provided.

Programming Notes

RENDER_SURFACE_STATE

		When TEXCOORDMODE_CLAMP is used when accessing a cube map, this field must be programmed to 1b (face enabled).
	4	**Cube Face Enable - Positive X** Exists If: [Surface Type] == 'SURFTYPE_CUBE' Format: Enable **For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine:** This field enable the individual face of a cube map. Enabling a face indicates that the face is present in the cube map, while disabling it indicates that that face is represented by the texture map's border color. Refer to Memory Data Formats for the correlation between faces and the cube map memory layout. Note that storage for disabled faces must be provided. **Programming Notes** When TEXCOORDMODE_CLAMP is used when accessing a cube map, this field must be programmed to 1b (face enabled).
	3	**Cube Face Enable - Negative Y** Exists If: [Surface Type] == 'SURFTYPE_CUBE' Format: Enable **For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine:** This field enable the individual face of a cube map. Enabling a face indicates that the face is present in the cube map, while disabling it indicates that that face is represented by the texture map's border color. Refer to Memory Data Formats for the correlation between faces and the cube map memory layout. Note that storage for disabled faces must be provided. **Programming Notes** When TEXCOORDMODE_CLAMP is used when accessing a cube map, this field must be programmed to 1b (face enabled).
	2	**Cube Face Enable - Positive Y** Exists If: [Surface Type] == 'SURFTYPE_CUBE' Format: Enable **For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine:** This field enable the individual face of a cube map. Enabling a face indicates that the face is present in the cube map, while disabling it indicates that that face is represented by the texture map's border color. Refer to Memory Data Formats for the correlation between faces and the cube map memory layout. Note that storage for disabled faces must be provided. **Programming Notes** When TEXCOORDMODE_CLAMP is used when accessing a cube map, this field must be programmed to 1b (face enabled).
	1	**Cube Face Enable - Negative Z** Exists If: [Surface Type] == 'SURFTYPE_CUBE' Format: Enable **For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine:** This field enable the individual face of a cube map. Enabling a face indicates that the face is

RENDER_SURFACE_STATE

present in the cube map, while disabling it indicates that that face is represented by the texture map's border color. Refer to Memory Data Formats for the correlation between faces and the cube map memory layout. Note that storage for disabled faces must be provided.

Programming Notes

When TEXCOORDMODE_CLAMP is used when accessing a cube map, this field must be programmed to 1b (face enabled).

5:0 Reserved

Exists If:	[Surface Type] != 'SURFTYPE_CUBE'
Format:	MBZ

0 Cube Face Enable - Positive Z

Exists If:	[Surface Type] == 'SURFTYPE_CUBE'
Format:	Enable

For SURFTYPE_CUBE Surfaces accessed via the Sampling Engine:

This field enable the individual face of a cube map. Enabling a face indicates that the face is present in the cube map, while disabling it indicates that that face is represented by the texture map's border color. Refer to Memory Data Formats for the correlation between faces and the cube map memory layout. Note that storage for disabled faces must be provided.

Programming Notes

When TEXCOORDMODE_CLAMP is used when accessing a cube map, this field must be programmed to 1b (face enabled).

1 31 Reserved

Format:	MBZ

30:24 Memory Object Control State

Format:	MEMORY_OBJECT_CONTROL_STATE

Specifies the memory object control state for this surface and the associated Auxiliary surface (if any).

23:19 Base Mip Level

Format:	U4.1

Range: [0.0, 14.0]

Specifies which mip level is considered the "base" level when determining mag-vs-min filter and selecting the "base" mip level.

Programming Notes

This field also exists in SAMPLER_STATE. If both fields are zero, the Base Mip Level is zero. If one is nonzero, Base Mip Level is the nonzero field. It is illegal to have both Base Mip Level fields nonzero.

RENDER_SURFACE_STATE

	18	**Reserved** Format: MBZ
	17	**Reserved** Format: MBZ
	16	**Reserved** Format: MBZ
	15	**Reserved** Format: MBZ
	14:0	**Surface QPitch** Format: QPitch[16:2]

Description

The interpretation of this field is dependent on Surface Type as follows:

- SURFTYPE_1D: distance in *pixels* between array slices
- SURFTYPE_2D/CUBE: distance in *rows* between array slices. For Quilted Textures this field specifies the distance in rows between *quilt* slices. For compressed texture formats, one row contains a complete compression block vertically.
- SURFTYPE_3D: distance in *rows* between R-slices [**Note:** these *rows* are only in the vertical dimension without considering the depth dimension]. For compressed texture formats, one row contains a complete compression block vertically.
- Other surface types: field is ignored

Value	Name	Description
[4h,1FFFCh]		in multiples of 4 (low 2 bits missing)

Programming Notes

For Surface Type 1D: This field must be set to an integer multiple of the **Surface Horizontal Alignment**
For Surface Type 2D, CUBE: This field must be set to an integer multiple of the **Surface Vertical Alignment**
For Surface Type 3D: *Tile Mode != Linear:* This field must be set to an integer multiple of the tile height (2^Cv) *Tile Mode == Linear:* This field must be set to an integer multiple of the Surface Vertical Alignment
Note: for compressed textures (BC*, FXT1, ETC*, EAC*), this field is in units of rows of compression blocks.

Note: for the compressed texture ASTC Surface Format, this field is in units of rows of compression blocks.

Software must ensure that this field is set to a value sufficiently large such that the array slices in the surface do not overlap. Refer to the Memory Data Formats section for information on

RENDER_SURFACE_STATE

how surfaces are stored in memory.

2 | 31:30 **Reserved**

Format:	MBZ

29:16 **Height**

Format:	U14-1

This field specifies the height of the surface, minus 1. If the surface is MIP-mapped, this field contains the height of the base MIP level. For buffers, this field specifies a portion of the buffer size.

Value	Name	Description	Exists If
[0,0]		must be zero	[Surface Type] == 'SURFTYPE_1D'
[0,16383]		height of surface - 1 (y/v dimension)	[SurfaceType] == 'SURFTYPE_2D'
[0,16383]		height of surface - 1 (y/v dimension)	[SurfaceType] == 'SURFTYPE_3D'
[0,16383]		height of surface - 1 (y/v dimension)	[SurfaceType] == 'SURFTYPE_CUBE'
[0,16383]		contains bits [20:7] of the number of entries in the buffer - 1	([SurfaceType] == 'SURFTYPE_BUFFER') || ([SurfaceType] == 'SURFTYPE_STRBUF')

Programming Notes

For typed buffer and structured buffer surfaces, the number of entries in the buffer ranges from 1 to 2^{27}. For raw buffer surfaces, the number of entries in the buffer is the number of bytes which can range from 1 to 2^{30}. After subtracting one from the number of entries, software must place the fields of the resulting 27-bit value into the **Height, Width**, and **Depth** fields as indicated, right-justified in each field. Unused upper bits must be set to zero.

If **Vertical Line Stride** is 1, this field indicates the height of the field, not the height of the frame

The **Height** of a render target must be the same as the **Height** of the other render targets and the depth buffer (defined in 3DSTATE_DEPTH_BUFFER), unless **Surface Type** is SURFTYPE_1D or SURFTYPE_2D with **Depth** = 0 (non-array) and **LOD** = 0 (non-mip mapped).

If this surface in memory is accessed with Vertical Line Stride set to both 0 and 1, this field must be an even value when Vertical Line Stride is 0.

If Media Pixel Boundary Mode is not set to NORMAL_MODE, this field must be an even value.

If Surface Format is PLANAR*, see **Planar Memory Organization** section for restrictions on the value of this field.

15:14 **Reserved**

Format:	MBZ

RENDER_SURFACE_STATE

13:0 **Width**

Format:	U14-1

Description
This field specifies the width of the surface, minus 1. If the surface is MIP-mapped, this field specifies the width of the base MIP level. The width is specified in units of pixels or texels. For buffers, this field specifies a portion of the buffer size.
For surfaces accessed with the Media Block Read/Write message, this field is in units of DWords.
For surfaces accessed with the Transpose Read Message, this field is in units of DWords.

Value	Name	Description	Exists If
[0,16383]		width of surface - 1 (x/u dimension)	[SurfaceType] == 'SURFTYPE_1D'
[0,16383]		width of surface - 1 (x/u dimension)	[SurfaceType] == 'SURFTYPE_2D'
[0,16383]		width of surface - 1 (x/u dimension)	[SurfaceType] == 'SURFTYPE_3D'
[0,16383]		width of surface - 1 (x/u dimension)	[SurfaceType] == 'SURFTYPE_CUBE'
[0,127]		contains bits [6:0] of the number of entries in the buffer - 1	([SurfaceType] == 'SURFTYPE_BUFFER') || ([SurfaceType] == 'SURFTYPE_STRBUF')

Programming Notes

- For surface types other than SURFTYPE_BUFFER or STRBUF The Width specified by this field must be less than or equal to the surface pitch (specified in bytes via the Surface Pitch field).
- For cube maps, Width must be set equal to the Height.
- For MONO8 textures, Width must be a multiple of 32 texels.
- The **Width** of a render target must be the same as the **Width** of the other render target(s) and the depth buffer (defined in 3DSTATE_DEPTH_BUFFER), unless **Surface Type** is SURFTYPE_1D or SURFTYPE_2D with **Depth** = 0 (non-array) and **LOD** = 0 (non-mip mapped).
- The **Width** of a render target with YUV surface format must be a multiple of 2.
- For SURFTYPE_BUFFER: The low two bits of this field must be 11 if the Surface Format is RAW (the size of the buffer must be a multiple of 4 bytes).

If **Surface Format** is PLANAR*, this field must be a multiple of 2

RENDER_SURFACE_STATE

3 — 31:21 Depth

Format:	U11-1

This field specifies the total number of levels, minus 1, for a volume texture or the number of array elements, minus 1, allowed to be accessed starting at the **Minimum Array Element** for arrayed surfaces. If the volume texture is MIP-mapped, this field specifies the depth of the base MIP level. For buffers, this field specifies a portion of the buffer size.

Value	Name	Description	Exists If
[0,2047]		number of array elements - 1	[SurfaceType] == 'SURFTYPE_1D'
[0,2047]		number of array elements - 1	[SurfaceType] == 'SURFTYPE_2D'
[0,2047]		depth of surface - 1 (z/r dimension)	[SurfaceType] == 'SURFTYPE_3D'
[0,340]		number of array elements - 1 [see programming notes for range]	[SurfaceType] == 'SURFTYPE_CUBE'
[0,2047]		contains bits [31:21] of the number of entries in the buffer - 1	([SurfaceType] == SURFTYPE_BUFFER) OR ([SurfaceType] == 'SURFTYPE_STRBUF')

Programming Notes

The **Depth** of a render target must be the same as the **Depth** of the other render target(s) and of the depth buffer (defined in 3DSTATE_DEPTH_BUFFER).

For SURFTYPE_CUBE: For Sampling Engine Surfaces and Typed Data Port Surfaces, the range of this field is [0,340], indicating the number of cube array elements (equal to the number of underlying 2D array elements divided by 6). For other surfaces, this field must be zero.

For SURFTYPE_1D, 2D, and CUBE: The range of this field is reduced by one for each increase from zero of **Minimum Array Element**. For example, if **Minimum Array Element** is set to 1024 on a 2D surface, the range of this field is reduced to [0,1023].

20 — Reserved

Format:	MBZ

19 — Reserved

Format:	MBZ

18 — Reserved

Format:	MBZ

17:0 — Surface Pitch

Format:	U18-1 Pitch in #Bytes

Surface Pitch Range:

- For surfaces of type SURFTYPE_BUFFER: [0,2047] -> [1B, 2048B]
- For surfaces of type SURFTYPE_STRBUF: [0,2047] -> [1B, 2048B]
- For other linear surfaces: [0, 262143] -> [1B, 256KB]

RENDER_SURFACE_STATE

- For X-tiled surface: [511, 262143] -> [512B, 256KB] = [1 tile, 512 tiles]
- For Y-tiled surfaces: [127, 262143]->[128B, 256KB] = [1 tile, 2048 tiles]
- For W-tiled surfaces: [127, 262143]->[128B, 256KB] = [1 tile, 2048 tiles]
- For TileYF and TileYS surfaces, the range is dependent on the Cu parameter (refer to *Memory Data Formats* section for the definition of the Cu parameter depending on the case). The range in bytes is [2^{Cu}-1,262143] -> [(2^{Cu})B,256KB] = [1 tile, 256KB/(2^{Cu}) tiles]

This field specifies the surface pitch in (#Bytes - 1).
For surfaces of type SURFTYPE_BUFFER and SURFTYPE_STRBUF, this field indicates the size of the structure.

Programming Notes

- For linear *render target* surfaces and surfaces accessed with the typed data port messages, the pitch must be a multiple of the element size for non-YUV surface formats. Pitch must be a multiple of 2 * element size for YUV surface formats.
- For untyped data port messages, which are only supported with **Surface Type** SURFTYPE_BUFFER, the pitch is ignored and assumed to be 1 byte.
- For linear surfaces with **Surface Type** of SURFTYPE_STRBUF, the pitch must be a multiple of 4 bytes.
- For linear surfaces with **Surface Type** of SURFTYPE_BUFFER and **Surface Format** RAW, the pitch must be 1 byte.
- For other linear surfaces, the pitch can be any multiple of bytes.
- For tiled surfaces, the pitch must be a multiple of the tile width.

If the surface is a stencil buffer (and thus has **Tile Mode** set to TILEMODE_WMAJOR), the pitch must be set to 2x the value computed based on width, as the stencil buffer is stored with two rows interleaved. For details on the separate stencil buffer storage format in memory, see GPU Overview (vol1a), Memory Data Formats, Surface Layout, 2D Surfaces, Stencil Buffer Layout (section 8.20.4.8).

- The width of a tile depends on the surface format if Tiled Resource Enable is enabled. Refer to the Tiled Resource Enable field to determine which sub-mode applies to the surface format in use, and determine the Cu parameter from the Surface Layout section. The tile width is equal to 2^Cu bytes.
- For surfaces of type SURFTYPE_1D, this field is ignored.

The following table indicates the maximum byte width, frame width, and pitch size allowed when memory compression is on.

Tiling Mode	Pixel Format	Max Frame Width (bytes)	Max Frame Width (pixels)	Max Pitch (bytes)
Legacy 4K	8bpp	16k	16k	16k + 127
	16bpp	16k	8k	16k + 127
	32bpp	16k	4k	16k + 127

RENDER_SURFACE_STATE

		64bpp	16k	2k	16k + 127
		128bpp	16k	1k	16k + 127
	TileYF	8bpp	8k	8k	8k + 63
		16bpp	16k	8k	16k + 127
		32bpp	16k	4k	16k + 127
		64bpp	16k	2k	16k + 255
		128bpp	16k	1k	16k + 255
	TileYS	8bpp	16k	16k	16k + 255
		16bpp	16k	8k	16k + 511
		32bpp	16k	4k	16k + 511
		64bpp	16k	2k	16k + 1023
		128bpp	16k	1k	16k + 1023

4 — 31 — Reserved

Exists If:	[Surface Type] != 'SURFTYPE_STRBUF'
Format:	MBZ

4 — 30:29 — Render Target And Sample Unorm Rotation

Exists If:	[Surface Type] != 'SURFTYPE_STRBUF'

Description

For Render Target Surfaces:
This field specifies the rotation of this render target surface when being written to memory.

For sample_unorm Messages: This field specifies the rotation of the data returned by sampler for sample_unorm message.

For Other Surfaces:
This field is ignored.

Value	Name	Description
0h	0DEG	No rotation (0 degrees)
1h	90DEG	Rotate by 90 degrees
2h	180DEG	Rotate by 180 degrees [for sample_unorm message]
3h	270DEG	Rotate by 270 degrees

Programming Notes

Programming Notes for Render Target Surfaces only

- Rotation is not supported for render targets of any type other than simple, non-mip-mapped, non-array 2D surfaces. The surface must be using tiled with X major.
- **Width** and **Height** fields apply to the dimensions of the surface before rotation.

RENDER_SURFACE_STATE

- For 90 and 270 degree rotated surfaces, the **Height** (rather than the **Width**) must be less than or equal to the **Surface Pitch** (specified in bytes).
- For 90 and 270 degree rotated surfaces, the actual **Height** and **Width** of the surface in pixels (not the field value which is decremented) must both be even.

Rotation is supported only for surfaces with the following surface formats: B5G6R5_UNORM, B5G6R5_UNORM_SRGB, R8G8B8A8_UNORM, R8G8B8A8_UNORM_SRGB, B8G8R8[A|X]8_UNORM, B8G8R8[A|X]8_UNORM_SRGB, B10G10R10[A|X]2_UNORM, B10G10R10A2_UNORM_SRGB, R10G10B10A2_UNORM, R10G10B10A2_UNORM_SRGB, R16G16B16A16_FLOAT, R16G16B16X16_FLOAT

28:18 **Minimum Array Element**

Exists If:	[Surface Type] != 'SURFTYPE_STRBUF'
Format:	U11

Description

17:7 **Render Target View Extent**

Exists If:	[Surface Type] != 'SURFTYPE_STRBUF'
Format:	U11-1

Range [0,2047] to indicate extent of [1,2048]
For Render Target and Typed Dataport 3D Surfaces:
This field indicates the extent of the accessible 'R' coordinates minus 1 on the LOD currently being rendered to.
For Render Target and Typed Dataport 1D and 2D Surfaces:
This field must be set to the same value as the Depth field.
For Other Surfaces:
This field is ignored.

6 **Multisampled Surface Storage Format**

Exists If:	[Surface Type] != 'SURFTYPE_STRBUF'

This field indicates the storage format of the multisampled surface.

Value	Name	Description
0h	MSS	Multsampled surface was/is rendered as a render target
1h	DEPTH_STENCIL	Multisampled surface was rendered as a depth or stencil buffer

Programming Notes

- All multisampled render target surfaces must have this field set to MSFMT_MSS
- IF this field is MSFMT_DEPTH_STENCIL, the only sampling engine messages allowed are

RENDER_SURFACE_STATE

"ld2dms", "resinfo", and "sampleinfo".

- This field is ignored if **Number of Multisamples** is MULTISAMPLECOUNT_1

5:3 Number of Multisamples

Exists If:	[Surface Type] != 'SURFTYPE_STRBUF'

This field indicates the number of multisamples on the surface.

Value	Name
0h	MULTISAMPLECOUNT_1
1h	MULTISAMPLECOUNT_2
2h	MULTISAMPLECOUNT_4
3h	MULTISAMPLECOUNT_8
4h	MULTISAMPLECOUNT_16
5h-7h	Reserved

Programming Notes

If this field is any value other than MULTISAMPLECOUNT_1, the **Surface Type** must be SURFTYPE_2D

This field must be set to MULTISAMPLECOUNT_1 unless the surface is a Sampling Engine surface or Render Target surface.

31:0 Reserved

Exists If:	[Surface Type] == 'SURFTYPE_STRBUF'
Format:	MBZ

2:0 Multisample Position Palette Index

Exists If:	[Surface Type] != 'SURFTYPE_STRBUF'

This field indicates the index into the sample position palette that the multisampled surface is using. This field is only used as a return value for the sampleinfo message, and is otherwise not used by hardware.

Value	Name
[0,7]	

5 31:25 X Offset

Format:	PixelOffset[8:2]

This field specifies the horizontal offset in pixels from the **Surface Base Address** to the start (origin) of the surface.

This field effectively loosens the alignment restrictions on the origin of tiled surfaces. Previously, tiled surface origin was (by definition) located at the base address, and thus needed to satisfy the 4KB base address alignment restriction. Now the origin can be specified at a finer (4-wide x 4-high pixel) resolution.

Value	Name	Description
[0,508]		In multiples of 4 (low 2 bits missing)

RENDER_SURFACE_STATE

Programming Notes

- For linear surfaces, this field must be zero.
- For surfaces accessed with the *Data Port Media Block Read/Write* message, the pixel size is assumed to be 32 bits in width.
- For surfaces accessed with the **Data Port Transpose Read message**, the pixel size is assumed to be 32 bits in width.
- For **Surface Format** with other than 8, 16, 32, 64, or 128 bits per pixel, this field must be zero.
- If **Render Target Rotation** is set to other than RTROTATE_0DEG, this field must be zero.
- If **Surface Type** not SURFTYPE_2D, this field must be zero.
- If **MIP Count** is not zero, this field must be zero.
- If **Number of Multisamples** is not MULTISAMPLECOUNT_1, this field must be zero.
- If **Surface Array** is enabled, this field must be zero.
- If **Auxiliary Surface Mode** is not AUX_NONE, this field must be zero.
- If **Surface Vertical Alignment** is VALIGN_8, this field must be a multiple of 8.
- For **Surface Format** with 8 bits per element, this field must be a multiple of 16.
- For **Surface Format** with 16 bits per element, this field must be a multiple of 8.

- If **Tiled Resource Mode** is not TRMODE_NONE, this field must be zero.

24 **Reserved**

Format:	MBZ

23:21 **Y Offset**

Format:	RowOffset[4:2]

This field specifies the vertical offset in rows from the **Surface Base Address** to the start of the surface. (See additional description in the **X Offset** field.)

Value	Name	Description
[0,28]		In multiples of 4 (low two bits missing)

Programming Notes

- For linear surfaces, this field must be zero.
- For render targets in which the **Render Target Array Index** is not zero, this field must be zero.
- For **Surface Format** with other than 8, 16, 32, 64, or 128 bits per pixel, this field must be zero.
- If **Render Target Rotation** is set to other than RTROTATE_0DEG, this field must be zero.
- If **Surface Type** not SURFTYPE_2D, this field must be zero.

RENDER_SURFACE_STATE

- If **MIP Count** is not zero, this field must be zero.
- If **Number of Multisamples** is not MULTISAMPLECOUNT_1, this field must be zero.
- If **Surface Array** is enabled, this field must be zero.
- If **Auxiliary Surface Mode** is not AUX_NONE, this field must be zero.

- If **Tiled Resource Mode** is not TRMODE_NONE, this field must be zero.

This field must be zero if Surface Format is Planar and the U and V planes are half-pitch (e.g. YV12 format).

20 **EWA Disable For Cube**

Format:	Disable

Specifies if EWA mode for LOD quality improvement needs to be disabled for cube maps.

Value	Name	Description
0h	Enable **[Default]**	EWA is enabled for cube maps
1h	Disable	EWA is disabled for cube maps

Programming Notes

This field indicates if EWA mode for LOD quality improvement needs to be disabled for cube maps.
By default EWA would be on for cube maps hence this field must be 0. If there is any spec violation seen with EWA on cube maps then this field must be set to 1 to disable EWA for cubes.

19:18 **Tiled Resource Mode**

For Sampling Engine, Render Target, and Typed/Untyped Surfaces:
This field specifies the tiled resource mode.

For other surfaces:
This field is ignored.

Value	Name	Description	Exists If
0h	NONE	No tiled resource	
1h	4KB	4KB tiled resources	[SurfaceType] == 'SURFTYPE_1D'
2h	64KB	64KB tiled resources	[SurfaceType] == 'SURFTYPE_1D'
1h	TILEYF	4KB tiled resources	[SurfaceType] != 'SURFTYPE_1D'
2h	TILEYS	64KB tiled resources	[SurfaceType] != 'SURFTYPE_1D'
3h	Reserved		

Programming Notes

If **Tile Mode** is not set to TILEMODE_YMAJOR, this field must be set to TRMODE_NONE, unless the Surface Type is SURFTYPE_1D.

If this field is not set to TRMODE_NONE, the **Surface Format** must be one with 8, 16, 32, 64, or

RENDER_SURFACE_STATE

128 bits per element, or one of the compressed texture modes (BC*, ETC*, EAC*, ASTC*). Additionally, YCRCB* formats are supported and treated as 16 bits per element, and the PLANAR_420_8 format is support and treated as 8 bits per element on the Y plane and 16 bits per element on the UV plane (if **Separate UV Plane Enable** is disabled) or 8 bits per element on the U and V planes (if **Separate UV Plane Enable** is enabled).

If this field is set to TRMODE_NONE, the surface cannot contain any null pages unless **Surface Type** is BUFFER or STRBUF. A BUFFER or STRBUF surface with null pages must have **Surface Base Address** and **Surface Pitch** set to an integer multiple of the element size, and **Surface Format** must be one with 8, 16, 32, 64, or 128 bits per element.

If **Surface Format** is PLANAR, the surface cannot contain any null pages.

17:16 **Reserved**

Format:	MBZ

15 **Reserved**

Format:	MBZ

14 **Coherency Type**

Specifies the type of coherency maintained for this surface.

Value	Name	Description
0h	GPU coherent	Surface memory is kept coherent with GPU threads using GPU read/write ordering rules. Surface memory is backed by system memory but is not kept coherent with CPU (LLC).
1h	IA coherent	Surface memory is kept coherent with CPU (LLC).

Programming Notes

This field may optionally be 1 (IA coherent) for messages sent to SFID_DP_DC0 or SFID_DP_DC1 or SFID_DP_DC2. This field is typically set to 0 (GPU coherent) if the context is operating in a non-SVM legacy mode (for example, Ring Buffer or a Execlist using 32-bit Virtual Address Legacy Context PPGTT32).

If the surface is not IA coherent, then it is possible that data written to Null Tile address will be cached, and then a later read to that same address might return a non-zero value. If a value is cached for a Null Tile address, the data will be eventually be discarded when the cache line is evicted. If the surface is IA coherent, then the cache line never contains a non-zero value, and Null Tile reads always return zero.

13:12 **Reserved**

Format:	MBZ

11:8 **Mip Tail Start LOD**

Format:	U4 in LOD Units

For Sampling Engine, Render Target, and Typed Surfaces:

This field indicates which LOD is the first one in the MIP tail if **Tiled Resource Mode** is not TRMODE_NONE. The MIP tail has a different layout than the rest of the surface. Refer to the

RENDER_SURFACE_STATE

Memory Data Formats section for more details.

For other surfaces:

This field is ignored.

Programming Notes
This field must be zero if the **Surface Format** is MONO8
This field is ignored if **Tiled Resource Mode** is TRMODE_NONE.
If **Tiled Resource Mode** is not TRMODE_NONE, this field must be set to ensure that mips within the mip tail do not overlap given the storage algorithms given in the Memory Data Formats section.
If **Tiled Resource Mode** is not TRMODE_NONE, to disable the Mip Tail this field must be set to a mip that larger than those present in the surface (i.e. 15). This is recommended for non-mip-mapped surfaces.
The following table indicates the *maximum* size of the mip that is set to be the Mip Tail Start LOD for various cases:

Surface Type	Tiling Mode	#MS	Bits Per Element				
			8	16	32	64	128
1D	64KB	1	16384	8192	4096	2048	1024
	4KB	1	1024	512	256	128	64
2D/ CUBE	TIleYS	1	128x256	128x128	64x128	64x64	32x64
		2	128x128	128x64	64x64	64x32	32x32
		4	64x128	64x64	32x64	32x32	16x32
		8	64x64	64x32	32x32	32x16	16x16
		16	32x64	32x32	16x32	16x16	8x16
	TileYF	any	32x64	32x32	16x32	16x16	8x16
3D	TIleYS	1	32x32x32	16x32x32	16x32x16	16x16x16	8x16x16
	TIleYF	1	16x8x16	8x8x16	8x8x8	8x4x8	4x4x8

7:4 **Surface Min LOD**

Format:	U4 In LOD Units

For Sampling Engine and Typed Surfaces:

This field indicates the most detailed LOD that can be accessed as part of this surface. This field is added to the delivered LOD (*sample_l, ld*, or *resinfo* message types) before it is used to address the surface.

For Other Surfaces:

This field is ignored.

Programming Notes
This field must be zero if the **Surface Format** is MONO8

RENDER_SURFACE_STATE

	3:0	**MIP Count / LOD** Format: **Sampling Engine and Typed Surfaces:** U4 in (LOD units - 1) **Render Target Surfaces:** U4 in LOD units Range **Sampling Engine and Typed Surfaces:** [0,14] representing [1,15] MIP levels **Render Target Surfaces:** [0,14] representing LOD **Other Surfaces:** [0] **For Sampling Engine and Typed Surfaces:** This field indicates the number of MIP levels allowed to be accessed starting at **Surface Min LOD**, which must be less than or equal to the number of MIP levels actually stored in memory for this surface. For sample* messages, the mip map access is clamped to be between the mipmap specified by the integer bits of the Min LOD and the ceiling of the value specified here. For ld* messages, out-of-bounds behavior results for LODs outside of the range specified in this field. **For Render Target Surfaces:** This field defines the MIP level that is currently being rendered into. This is the absolute MIP level on the surface and is not relative to the **Surface Min LOD** field, which is ignored for render target surfaces. **For Other Surfaces:** This field is reserved : MBZ **Programming Notes** The **LOD** of a render target must be the same as the **LOD** of the other render target(s) and of the depth buffer (defined in 3DSTATE_DEPTH_BUFFER). For render targets with YUV surface formats, the **LOD** must be zero. For sampling engine surfaces with YCRCB* or PLANAR* surface format, **MIP Count** must be zero.
6	31	**Reserved** Exists If: ([Surface Format] != 'PLANAR') Format: MBZ
	31	**Separate UV Plane Enable** Exists If: ([Surface Format] == 'PLANAR') Format: Enable If enabled, this field indicates that the U and V are present as separate planes. If disabled, the UV data is interleaved on a single plane. **Programming Notes** This field must be disabled (separate UV planes are not supported). See the section "Planar Memory Organization" for a description of how the size and location of the chroma planes (U and V) are calculated.

RENDER_SURFACE_STATE

30 Reserved

Exists If:	([Surface Format] == 'PLANAR')
Format:	MBZ

30:16 Auxiliary Surface QPitch

Exists If:	([Surface Format] != 'PLANAR')
Format:	QPitch[16:2]

This field specifies the distance in rows between array slices on the auxiliary surface.

Value	Name	Description
[4h,1FFFCh]		in multiples of 4 (low 2 bits missing)

Programming Notes
This field must be set to an integer multiple of the **Surface Vertical Alignment**
Software must ensure that this field is set to a value sufficiently large such that the array slices in the auxiliary surface do not overlap. Refer to the Memory Data Formats section for information on how surfaces are stored in memory.
For non-multisampled render target's CCS auxiliary surface, QPitch must be computed with Horizontal Alignment = 128 and Surface Vertical Alignment = 256. These alignments are only for CCS buffer and not for associated render target.

29:16 X Offset for U or UV Plane

Exists If:	([Surface Format] == 'PLANAR')
Format:	U14

This field specifies the horizontal offset in pixels from the **Surface Base Address** to the start (origin) of the U plane or interleaved UV plane, depending on the setting of **Separate UV Plane Enable**.

Programming Notes
This field must be a multiple of 4 (bits 1:0 MBZ).
If **Tiled Resource Mode** is enabled, this field must be a multiple of the tile width in pixels.
Auxiliary Surface Mode is forced to AUX_NONE.

15 Reserved

Format:	MBZ

14 Reserved

Exists If:	([Surface Format] == 'PLANAR')
Format:	MBZ

14:12 Reserved

Exists If:	([Surface Format] != 'PLANAR')
Format:	MBZ

RENDER_SURFACE_STATE

11:3 **Auxiliary Surface Pitch**

Exists If:	([Surface Format] != 'PLANAR')
Format:	U9-1 Pitch in #Tiles

This field specifies the Auxiliary surface pitch in (#Tiles - 1).

Value	Name	Description
[0, 511]		-> [1 tile, 512 tiles]

13:0 **Y Offset for U or UV Plane**

Exists If:	([Surface Format] == 'PLANAR')
Format:	U14

This field specifies the vertical offset in rows from the **Surface Base Address** to the start (origin) of the U plane or interleaved UV plane, depending on the setting of **Separate UV Plane Enable**.

Programming Notes
For surfaces where **Surface Format** = PLANAR* and **Separate UV Plane** is Enabled, the Y Offset must be programmed in multiples of **half-rows**. For example, for a surface where Y is physically followed by U and then V in memory, the Y Offset to U plane would be (2*Y-Height). For all other PLANAR YUV formats this is programmed in multiples of full rows.
For all format besides PLANAR_420_* This field must be a multiple of 4 (bits 1:0 MBZ). For formats PLANAR_420_* with separate chroma planes (e.g. YV12) this field must be multiple of 4 if U plane is the first chroma plane after the Y (luma) plane. It can be a multiple of 2 if it is the second chroma plane in memory. For formats PLANAR_420_* with interleaved chroma planes (e.g. NV12) this field can be multiple of 2.
If **Tiled Resource Mode** is enabled, this field must be a multiple of the tile height in rows.
Auxiliary Surface Mode is forced to AUX_NONE.

Workaround
Workaround : For formats PLANAR_420_* when this field is not a multiple of 4 the Out-of-Bounds Supression check must be disabled (HALF_SLICE_CHICKEN3[5] must be set to 1) to avoid false out of bound detection.

2:0 **Auxiliary Surface Mode**

Exists If:	([Surface Format] != 'PLANAR')
Format:	U3

Specifies what type of surface the Auxiliary surface is. The Auxiliary surface has its own base address and pitch, but otherwise shares or overrides other fields set for the primary surface, detailed in the programming notes below.

Value	Name	Description
0h	AUX_NONE	No Auxiliary surface is used
1h	AUX_CCS_D	The Auxiliary surface is a CCS (Color Control Surface) with compression disabled or an MCS with compression enabled, depending on **Number of Multisamples**. MCS (Multisample Control Surface) is a special type of CCS.

RENDER_SURFACE_STATE

2h	AUX_APPEND	The Auxiliary surface is an append buffer
3h	AUX_HIZ	The Auxiliary surface is a hierarchical depth buffer
4h	Reserved	
5h	AUX_CCS_E	The Auxiliary surface is a CCS with compression enabled or an MCS with compression enabled, depending on **Number of Multisamples**.
6h-7h	Reserved	

Programming Notes

The CCS and hierarchical depth Auxiliary surface shares **Height, Width, Depth, Surface Type, Surface Array, Surface Min LOD, MIP Count / LOD, Surface Object Control State, Resource Min LOD**, and **Minimum Array Element** with the primary surface. The hierarchical depth Auxiliary surface uses **Surface Horizontal Alignment** of 16, **Surface Vertical Alignment** of 8, regardless of the primary surface's values for these fields. **X & Y Offset** are set to zero for the purpose of accessing the Auxiliary surface. If this field is set to AUX_HIZ, **Surface Format** must be be one of the following: R32_FLOAT, R24_UNORM_X8_TYPELESS, or R16_UNORM, and the format must match the format used when the surface was used as a depth buffer (with R channel corresponding to D channel).

CCS and hierarchical depth Auxiliary surfaces are TileY with **Tiled Resource Mode** of TRMODE_NONE regardless of the tile mode of the primary surface, and **Mip Tail Start LOD** is ignored for these surfaces.

The CCS Auxiliary surface for non-multisampled render targets has Horizontal Alignment = 128 and Vertical alignment = 64.

The CCS Auxiliary surface for **Number of Multisamples** > 1 uses **Surface Horizontal Alignment** of 16 and **Surface Vertical Alignment** of 4 regardless of the primary surface's values for these fields.

If this field is set to AUX_HIZ, **Number of Multisamples** must be MULTISAMPLECOUNT_1, and Surface Type cannot be SURFTYPE_3D.

If **Number of Multisamples** is MULTISAMPLECOUNT_1, AUX_CCS_E setting is only allowed if **Surface Format** is supported for Render Target Compression. This setting enables render target compression.

If **Number of Multisamples** is MULTISAMPLECOUNT_1, AUX_CCS_D setting is only allowed if **Surface Format** supported for Fast Clear. In addition, if the surface is bound to the sampling engine, **Surface Format** must be supported for Render Target Compression for surfaces bound to the sampling engine. For render target surfaces, this setting disables render target compression. For sampling engine surfaces, this mode behaves the same as AUX_CCS_E.

If **Number of Multisamples** is *not* MULTISAMPLECOUNT_1, both AUX_CCS_E and AUX_CCS_D settings indicate that the auxiliary surface is a multisample control surface (MCS), and multisample compression is enabled.

If **Number of Multisamples** is MULTISAMPLECOUNT_1, and if **Tiled Resource Mode** is NOT TRMODE_NONE, then, if CCS tile is NULL, Render Target Tiles represented by that CCS tile are assumed to be NULL by HW.

RENDER_SURFACE_STATE

7 — 31 — Memory Compression Mode

Distinguishes Vertical from Horizontal compression.

Value	Name	Description
0	Horizontal **[Default]**	
1	Vertical	

30 — Memory Compression Enable

Format:	Enable

This surface may contain compressed or compressible pixels. Memory compression will be attempted for writes to this surface. Reads from this surface will check for compressed data.

Programming Notes
The compression control must have 0 value for non-tileY modes. The Memory Compression Enable can be non-zero only for the surface state that has media messages. That is for 3d case the compression control bits will be 0 in normal surface state but can be non-zero in normal surface state for media messages. E.g. sample_unorm.
The only sampler messages supported with memory compression enabled are *sample_8x8*, *sample_unorm*, and SIMD16 *sample*.
Please refer to vol1a Memory Data Formats chapter >section Media Memory Compression for more details, including format restrictions.

29 — Reserved

Format:	MBZ

28 — Reserved

27:25 — Shader Channel Select Red

Format:	**Shader Channel Select** Enumerated Type

Specifies which surface channel is read or written in the Red shader channel.

Programming Notes
The Shader channel selects also define which shader channels are written to which surface channel. If the Shader channel select is SCS_ZERO or SCS_ONE then it is not written to the surface. If the shader channel select is SCS_RED it is written to the surface red channel and so on. If more than one shader channel select is set to the same surface channel only the first shader channel in RGBA order will be written. Each shader channel select must be set to the same surface channel (R = SCS_RED, G = SCS_GREEN, B = SCS_BLUE, A = SCS_ALPHA) if the surface is accessed via the sampler's sample_unorm* or sample_8x8 messages.
The Shader Channel Select fields do not affect the following sampling engine message types: resinfo, sampleinfo, LOD, and ld_mcs. These messages behave as if each Shader Channel Select is set to the same color surface channel.
For the sampling engine *gather4** messages, the Gather4 Source Channel Select field in the message header defines which channel's Shader Channel Select is used to select the surface channel to be sampled. Other Shader Channel Select fields are ignored.
For the sampling engine *sample*_c* and *gather4*_c* messages, the compare operation always occurs on the red channel from the surface regardless of the setting of the Shader Channel

RENDER_SURFACE_STATE

		Select fields. For Render Target, Red, Green and Blue Shader Channel Selects MUST be such that only valid components can be swapped i.e. only change the order of components in the pixel. Any other values for these Shader Channel Select fields are not valid for Render Targets. This also means that there MUST not be multiple shader channels mapped to the same RT channel. When multiple Channel selects have the same value and shader channel is disabled, disable channel writes 0s to memory. This behavior does not match with Data Port message via HDC. The output channel is undefined if the source is to a channel is not present for the current surface format. For example, If the surface format is R16_float and the shader channel select green specifies green as the source the output is undefined. It should instead select 0 which is the default for a missing color channel..
	24:22	**Shader Channel Select Green** Format: **Shader Channel Select** Enumerated Type See **Shader Channel Select Red** for details.
	21:19	**Shader Channel Select Blue** Format: **Shader Channel Select** Enumerated Type See **Shader Channel Select Red** for details.
	18:16	**Shader Channel Select Alpha** Format: **Shader Channel Select** Enumerated Type See **Shader Channel Select Red** for details. **Programming Notes** For Render Target, this field MUST be programmed to value = SCS_ALPHA.
	15:12	**Reserved** Format: MBZ
	11:0	**Resource Min LOD** Format: U4.8 in LOD units **For Sampling Engine Surfaces:** This field indicates the most detailed LOD that is present in the resource underlying the surface. Refer to the "LOD Computation Pseudocode" section for the use of this field. **For Other Surfaces:** This field is ignored. **Value** / **Name**: [0,14] **Programming Notes** This field must be zero if the **Surface Format** is MONO8 This field must be zero if the **ChromaKey Enable** is enabled in the associated sampler.

RENDER_SURFACE_STATE

8..9	63:0	**Surface Base Address** Format: GraphicsAddress[63:0]SurfaceBase Specifies the byte-aligned base address of the surface. **Programming Notes** • For SURFTYPE_BUFFER render targets, this field specifies the base address of first element of the surface. The surface is interpreted as a simple array of that single element type. The address must be naturally-aligned to the element size (e.g., a buffer containing R32G32B32A32_FLOAT elements must be 16-byte aligned). • For SURFTYPE_BUFFER non-rendertarget surfaces, this field specifies the base address of the first element of the surface, computed in software by adding the surface base address to the byte offset of the element in the buffer. The base address must be aligned to element size. • Linear depth buffer surface base addresses must be 64-byte aligned. Note that while render targets (color) can be SURFTYPE_BUFFER, depth buffers cannot. • Mipmapped surfaces are stored in a "monolithic" (fixed) format, and only require a single address for the base MIP. All other MIPs are positioned relative to the base MIP. • The Base Address for linear (non-tiled) render target surfaces and surfaces accessed with the typed surface read/write data port messages must be element-size aligned for Non-YUV surface formats, or a multiple of 2 element-sizes for YUV surface formats. • Other linear (non-tiled) surfaces have no alignment requirements (byte alignment is sufficient). • For tiled surfaces, the actual start of the surface can be offset from the Surface Base Address by the X Offset and Y Offset fields. Tiles are inherently page-aligned (4K or 64K). • Certain message types used to access surfaces have more stringent alignment requirements. Please refer to the specific data-port message documentation for additional restrictions. Tiled surface base addresses must be 4KB-aligned. Note that only the offsets from Surface Base Address are tiled, Surface Base Address itself is not transformed using the tiling algorithm. Tiled surface base addresses must be tile aligned (64KB aligned for TileYS, 4KB aligned for all other tile modes). For 1D surfaces, the base address must be 64KB aligned if Tiled Resource Mode is TRMODE_64KB, and 4KB aligned if Tiled Resource Mode is TRMODE_4KB. Compressed (BC*, ASTC, etc.) surface data is usually copied by re-describing each MIP/slice as a separate surface, using a size-equivalent RGBA format. But a MIP/slice within a packed **MIP**

RENDER_SURFACE_STATE

		Tail doesn't have the tile-aligned **Surface Base Address** required for the re-description. This case must be specially handled by re-describing the packed **MIP Tail** as a single-MIP surface with the width/pitch/height/depth of a single tile, and then use drawing geometry to "reach out" to the desired tail slot (*x*, *y*, *z*) offset.
10..11	63:62	**Reserved** Exists If: ([Surface Format] == 'PLANAR') Format: MBZ
	61:48	**X Offset for V Plane** Exists If: ([Surface Format] == 'PLANAR') Format: U14 This field specifies the horizontal offset in pixels from the **Surface Base Address** to the start (origin) of the V plane. **Programming Notes** This field must be a multiple of 4 (bits 1:0 MBZ). If **Tiled Resource Mode** is enabled, this field must be a multiple of the tile width in pixels. This field is ignored if **Separate UV Plane Enable** is disabled.
	47:46	**Reserved** Exists If: ([Surface Format] == 'PLANAR') Format: MBZ
	45:32	**Y Offset for V Plane** Exists If: ([Surface Format] == 'PLANAR') Format: U14 This field specifies the vertical offset in rows from the **Surface Base Address** to the start (origin) of the V plane. **Programming Notes** For surfaces where **Surface Format** = PLANAR* and **Separate UV Plane** is Enabled, the Y Offset must be programmed in multiples of **half-rows**. For example, for a surface where Y is physically followed by U and then V in memory, the Y Offset to V plane would be (2*Y-Height+ U-Height). For all other PLANAR YUV formats this is programmed in multiples of full rows (e.g Y-Height + U-Height). For all format besides PLANAR_420_* This field must be a multiple of 4 (bits 1:0 MBZ). For formats PLANAR_420_* this field must be multiple of 4 if U plane is the first chroma plane after the Y (luma) plane. It can be a multiple of 2 if it is the second chroma plane. For formats PLANAR_420_* when this field is not a multiple of 4 the Out-of-Bounds Supression check must be disabled (HALF_SLICE_CHICKEN3[5] must be set to 1) to avoid false out of bound detection. If **Tiled Resource Mode** is enabled, this field must be a multiple of the tile height in rows. This field is ignored if **Separate UV Plane Enable** is disabled.

RENDER_SURFACE_STATE

	31:21	**Auxiliary Table Index for Media Compressed Surface** Exists If: [Memory Compression Enable] ==1 This field is valid only if Media Memory Compression is on for the surface(Memory Compression Enable == 1). In that case, the Auxiliary Surface Base address is never expected to be used and hence can be overloaded. This represents the 11 bit index into the table in memory which maps the surface to the auxiliary base address.
	63:12	**Auxiliary Surface Base Address** Exists If: ([Surface Format] != 'PLANAR') AND [Memory Compression Enable] == 0 Format: GraphicsAddress[63:12] Specifies the 4kbyte-aligned base address of the Auxiliary surface associated with the primary surface specified in other SURFACE_STATE fields.
	11	**Reserved** Format: MBZ
	10	**Reserved** Format: MBZ
	9:5	**Quilt Height** Format: U5 This field specifies the height of a quilted texture in units of quilt slices. Refer to the section on Quilted Textures for more details.

Value	Name	Description
[0,31]		representing height of quilt - 1 (y/v dimension)

Programming Notes

Programming Notes

- Only power-of-2 **Quilt Height** and **Quilt Width** values are allowed: (1,2,4,8,16,32) mapping to (0,1,3,7,15,31) values in the fields.
- A surface is defined as a quilted texture if either **Quilt Height** or **Quilt Width** is nonzero (actual field value, not the incremented value).
- A quilted texture
  - is only supported by the sampling engine (other shared functions will ignore the **Quilt Width** and **Quilt Height** field, behaving as if they are set to zero).
  - must have a **Surface Type** of SURFTYPE_2D.
  - must have **Number of Multisamples** set to NUMSAMPLES_1.
  - must have **Vertical Line Stride** set to 0.
  - must have **Auxiliary Surface Mode** set to AUX_NONE.
  - **Depth** indicates the array dimension of the quilted texture if **Surface Array** is enabled. The valid range of **Depth** is [0, 2048 / (QuiltWidth * QuiltHeight) - 1], i.e.

RENDER_SURFACE_STATE

the total number of underlying array slices including quilt slices cannot exceed 2048.

- cannot be accessed with any ld* message type or using a sampler with the **Non-Normalized Coordinate Enable** field enabled.

4:0 Quilt Width

Format:	U5

This field specifies the width of a quilted texture in units of quilt slices. Refer to the section on Quilted Textures for more details.

Value	Name	Description
[0,31]		representing width of quilt - 1 (x/u dimension)

12 31:0 Reserved

Exists If:	([Auxiliary Surface Mode] != 'AUX_CCS_D') AND ([Auxiliary Surface Mode] != 'AUX_CCS_E') AND ([Auxiliary Surface Mode] != 'AUX_HIZ)
Format:	MBZ

31:0 Red Clear Color

Exists If:	[Auxiliary Surface Mode] == 'AUX_CCS_D' OR [Auxiliary Surface Mode] == 'AUX_CCS_E'
Format:	S31 (2's complement) for all SINT surface formats
Format:	U32 for all UINT surface formats
Format:	IEEE_FP for all other surface formats

For Sampling Engine Surfaces and Render Targets with Auxiliary Surface Mode set to AUX_CCS:

Specifies the clear value for the red channel.

For Other Surfaces:

This field is ignored.

Programming Notes
If Number of Multisamples is not MULTISAMPLECOUNT_1, only 0/1 values allowed
If Number of Multisamples is MULTISAMPLECOUNT_1 AND if this RT is fast cleared with non-0/1 clear value, this RT must be partially resolved (refer to Partial Resolve operation) before binding this surface to Sampler.

31:0 Hierarchical Depth Clear Value

Exists If:	[Auxiliary Surface Mode] == 'AUX_HIZ'
Format:	IEEE_Float

If **Auxiliary Surface Mode** is AUX_HIZ, this field specifies the depth clear value associated with this surface. If disabled, this field is ignored.

RENDER_SURFACE_STATE

13	31:0	**Green Clear Color** Exists If: [Auxiliary Surface Mode] == 'AUX_CCS_D' OR [Auxiliary Surface Mode] == 'AUX_CCS_E' Format: S31 (2's complement) for all SINT surface formats Format: U32 for all UINT surface formats Format: IEEE_FP for all other surface formats **For Sampling Engine Surfaces and Render Targets with Auxiliary Surface Mode set to AUX_CCS:** Specifies the clear value for the green channel. **For Other Surfaces:** This field is ignored. **Programming Notes** If programmed to non 0/1 values, SW must ensure a render target partial resolve pass before binding a cleared RT to texture.
	31:0	**Reserved** Exists If: [Auxiliary Surface Mode] == 'AUX_HIZ' Format: MBZ
14	31:0	**Blue Clear Color** Exists If: [Auxiliary Surface Mode] == 'AUX_CCS_D' OR [Auxiliary Surface Mode] == 'AUX_CCS_E' Format: S31 (2's complement) for all SINT surface formats Format: U32 for all UINT surface formats Format: IEEE_FP for all other surface formats **For Sampling Engine Surfaces and Render Targets with Auxiliary Surface Mode set to AUX_CCS:** Specifies the clear value for the blue channel. **For Other Surfaces:** This field is ignored. **Programming Notes** If programmed to non 0/1 values, SW must ensure a render target partial resolve pass before binding a cleared RT to texture.
	31:0	**Reserved** Exists If: [Auxiliary Surface Mode] == 'AUX_HIZ' Format: MBZ

RENDER_SURFACE_STATE

15	31:0	**Alpha Clear Color** Exists If: [Auxiliary Surface Mode] == 'AUX_CCS_D' OR [Auxiliary Surface Mode] == 'AUX_CCS_E' Format: S31 (2's complement) for all SINT surface formats Format: U32 for all UINT surface formats Format: IEEE_FP for all other surface formats **For Sampling Engine Surfaces and Render Targets with Auxiliary Surface Mode set to AUX_CCS:** Specifies the clear value for the alpha channel. **For Other Surfaces:** This field is ignored. **Programming Notes** If programmed to non 0/1 values, SW must ensure a render target partial resolve pass before binding a cleared RT to texture.
	31:0	**Reserved** Exists If: [Auxiliary Surface Mode] == 'AUX_HIZ' Format: MBZ

Render Data Port Message Types

MT_DP_RT - Render Data Port Message Types

Source:	Render Cache DataPort
Size (in bits):	5
Default Value:	0x0000000C

Lists all the Message Types in a Render Data Port Message Descriptor [18:14].

DWord	Bit	Description
0	4	**Reserved** Format: MBZ Ignored
	3:0	**Message Type** Format: Enumeration Specifies type of message

Value	Name	Description
0Ch	MT_RTW **[Default]**	Render Target Write message
0Dh	MT_RTR	Render Target Read message
Others	Reserved	Ignored

Render Target Index Message Header Control

MHC_RT_RTI - Render Target Index Message Header Control

Source:	BSpec
Size (in bits):	32
Default Value:	0x00000000

DWord	Bit	Description
0	31:3	**Reserved** Format: Ignore Ignored
	2:0	**Render Target Index** Format: U3 Specifies the render target index that will be used to select blend state from BLEND_STATE.

Render Target Message Header

Render Target Message Header Control

MHC_RT_C0 - Render Target Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31	**Reserved** Format: Ignore Ignored
	30:27	**Viewport Index** Format: U4 For Render Target Write message, specifies the index of the viewport currently being used. Range = [0,15] Ignored by Render Target Read message.
	26:16	**Render Target Array Index** Format: U11 Specifies the array index to be used for the following surface types: SURFTYPE_1D: specifies the array index. Range = [0,511] SURFTYPE_2D: specifies the array index. Range = [0,511] SURFTYPE_3D: specifies the Z or R coordinate. Range = [0,2047] SURFTYPE_BUFFER: must be zero. SURFTYPE_CUBE: specifies the face identifier. Mapping (0,+x) (1,-x) (2,+y) (3,-y) (4,+z) (5,-z). **Programming Notes** The Render Target Array Index used by hardware for access to the Render Target is overridden with the Minimum Array Element defined in SURFACE_STATE if it is out of the range between Minimum Array Element and Depth. For cube surfaces, a depth value of 5 is used for this determination.
	15	**Front/Back Facing Polygon** Format: U1 Determines whether the polygon is front or back facing. Used by the render cache to determine which stencil test state to use. Value / Name / Description 0h / Front facing / All 1h / Back facing / All
	14	**Stencil Present to Render Target** Format: Enable For Render Target Write message, indicates that computed stencil is included in the message. Must be zero for Render Target Read message.

MHC_RT_C0 - Render Target Message Header Control

	13	**Source Depth Present to Render Target** Format: Enable For Render Target Write Message, indicates that source depth data is included in the message. Must be zero for Render Target Read message.
	12	**oMask to Render Target** Format: Enable For Render Target Write message, indicates that oMask data is present in the message and is to be used to mask off samples. Must be zero for Render Target Read message.
	11	**Source0 Alpha Present to Render Target** Format: Enable For Render Target Write message, indicates that Source0 Alpha (aka o0.a) data is included in RTWrite message. If present, these alpha values are used as inputs to AlphaTest and AlphaToCoverage functions. This is required to meet the API rules when writing to multiple render targets (MRTs). Must be zero for Render Target Read message. **Programming Notes** This bit should not be set when write to RT0, though sending and using redundant alpha will provide the correct results (at lower performance). This bit is not supported on Dual-Source Blend message types, as source0 alpha is already included in those messages. This bit is not supported on replicated data message types.
	10	**Reserved** Format: Ignore Ignored
	9:6	**Starting Sample Pair Index or Sample Index** Format: U4 When pixel shader is dispatched in per-sample mode or per-pixel mode with Per-Sample PS Enable bit cleared, this field indicates the index of the first sample pair of the dispatch. Range = [0,7]. When pixel shader is dispatched in per-pixel mode with Per-Sample PS Enable bit set, this field indicates the index of a sample referenced by per-sample RT read or RT write messages. Range = [0, 15].
	5:0	**Reserved** Format: Ignore Ignored

SAMPLER_BORDER_COLOR_STATE

SAMPLER_BORDER_COLOR_STATE

Source:	BSpec
Size (in bits):	128
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000

Description

The interpretation of the border color depends on the Texture Border Color Mode field in SAMPLER_STATE as follows:

- DX9 mode: The border color is 8-bit UNORM format, regardless of the surface format chosen. For surface formats with one or more channels missing (i.e. R5G6R5_UNORM is missing the alpha channel), the value from the border color, if selected, will be used even for the missing channels.
- DX10/OGL mode: the format of the border color depends on the format of the surface being sampled. If the map format is UINT, then the border color format is R32G32B32A32_UINT. If the map format is SINT, then the border color format is R32G32B32A32_SINT. Otherwise, the border color format is R32G32B32A32_FLOAT. For surface formats with one or more channels missing, the value from the border color is not used for the missing channels, resulting in these channels resulting in the overall default value (0 for colors and 1 for alpha) regardless of whether border color is chosen. The surface formats with "L" and "I" have special behavior with respect to the border color. The border color value used for the replicated channels (RGB for "L" formats and RGBA for "I" formats) comes from the red channel of border color. In these cases, the green and blue channels, and also alpha for "I", of the border color are ignored.The format of this state depends on the Texture Border Color Mode field.

Programming Notes

- DX9 mode is not supported for surfaces with more than 16 bits in any channel, other than 32-bit float formats which are supported.
- The conditions under which this color is used depend on the **Surface Type** - 1D/2D/3D surfaces use the border color when the coordinates extend beyond the surface extent; cube surfaces use the border color for "empty" (disabled) faces.
- The border color itself is accessed through the texture cache hierarchy rather than the state cache hierarchy. Thus, if the border color is changed in memory, the texture cache must be invalidated and the state cache does not need to be invalidated.
- MAPFILTER_MONO: The border color is ignored. Border color is fixed at a value of 0 by hardware.

SAMPLER_INDIRECT_STATE_BORDER_COLOR

SAMPLER_INDIRECT_STATE_BORDER_COLOR

Source:	BSpec
Size (in bits):	128
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000

This structure is a one version of the SAMPLER_INDIRECT_STATE structure, suitable for many needs.
An instance of this structure is pointed to by the **Indirect State Pointer** field in SAMPLER_STATE.
The interpretation of the border color depends on the **Texture Border Color Mode** field in SAMPLER_STATE as follows:

- In **DX9** mode, the border color is 8-bit UNORM format, regardless of the surface format chosen. For surface formats with one or more channels missing (i.e. R5G6R5_UNORM is missing the alpha channel), the value from the border color, if selected, will be used *even for the missing channels*.
- In **DX10/OGL** mode, the format of the border color is R32G32B32A32_FLOAT, R32G32B32A32_SINT, or R32G32B32A32_UINT, depending on the surface format chosen. For surface formats with one or more channels missing, the value from the border color is not used for the missing channels, resulting in these channels resulting in the overall default value (0 for colors and 1 for alpha) regardless of whether border color is chosen. The surface formats with "L" and "I" have special behavior with respect to the border color. The border color value used for the replicated channels (RGB for "L" formats and RGBA for "I" formats) comes from the *red* channel of border color. In these cases, the green and blue channels, and also alpha for "I", of the border color are ignored.

Programming Notes

- DX9 mode is not supported for surfaces with more than 16 bits in any channel, other than 32-bit float formats which are supported.
- The conditions under which this color is used depend on the **Surface Type** - 1D/2D/3D surfaces use the border color when the coordinates extend beyond the surface extent; cube surfaces use the border color for "empty" (disabled) faces.
- The border color itself is accessed through the texture cache hierarchy rather than the state cache hierarchy. Thus, if the border color is changed in memory, the texture cache must be invalidated and the state cache does not need to be invalidated.
- MAPFILTER_MONO: The border color is ignored. Border color is fixed at a value of 0 by hardware.

SAMPLER_INDIRECT_STATE

SAMPLER_INDIRECT_STATE

Source:	BSpec
Size (in bits):	512
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

Note: There are three variations of this structure, defined separately because their payloads have different lengths. Currently only SAMPLER_INDIRECT_STATE_BORDER_COLOR is fully defined.
This structure is pointed to by **Indirect State Pointer** (SAMPLER_STATE).
The interpretation of the border color depends on the **Texture Border Color Mode** field in SAMPLER_STATE as follows:

- In **DX9** mode, the border color is 8-bit UNORM format, regardless of the surface format chosen. For surface formats with one or more channels missing (i.e. R5G6R5_UNORM is missing the alpha channel), the value from the border color, if selected, will be used *even for the missing channels*.
- In **DX10/OGL** mode, the format of the border color is R32G32B32A32_FLOAT, R32G32B32A32_SINT, or R32G32B32A32_UINT, depending on the surface format chosen. For surface formats with one or more channels missing, the value from the border color is not used for the missing channels, resulting in these channels resulting in the overall default value (0 for colors and 1 for alpha) regardless of whether border color is chosen. The surface formats with "L" and "I" have special behavior with respect to the border color. The border color value used for the replicated channels (RGB for "L" formats and RGBA for "I" formats) comes from the *red* channel of border color. In these cases, the green and blue channels, and also alpha for "I", of the border color are ignored.

The format of this state depends on the **Texture Border Color Mode** field.

Programming Notes

- DX9 mode is not supported for surfaces with more than 16 bits in any channel, other than 32-bit float formats which are supported.
- The conditions under which this color is used depend on the **Surface Type** - 1D/2D/3D surfaces use the border color when the coordinates extend beyond the surface extent; cube surfaces use the border color for "empty" (disabled) faces.
- The border color itself is accessed through the texture cache hierarchy rather than the state cache hierarchy. Thus, if the border color is changed in memory, the texture cache must be invalidated and the state cache does not need to be invalidated.
- MAPFILTER_MONO: The border color is ignored. Border color is fixed at a value of 0 by hardware.

SAMPLER_STATE_8x8_AVS

3 / 31 — Skin Tone Tuned IEF _ Enable

Default Value:	1
Format:	U1

Control bit to enable the skin tone tuned IEF.

3 / 30 — IEF4Smooth_Enable

Format:	U1

Value	Name	Description
0	**[Default]**	IEF is operating as a content adaptive detail filter based on 5x5 region
1		IEF is operating as a content adaptive smooth filter based on 3x3 region

3 / 29:28 — Enable 8-tap filter

Adaptive Filtering (Mode = 11) ExistsIf:
R10G10B10A2_UNORM R8G8B8A8_UNORM (AYUV also) R8B8G8A8_UNORM B8G8R8A8_UNORM R16G16B16A16

Enable 8-tap Filtering on UV channel (Mode = 10) ExistsIf:
R10G10B10A2_UNORM
R8G8B8A8_UNORM (AYUV also)
R8B8_UNORM (CrCb)
R8_UNORM
R8B8G8A8_UNORM
B8G8R8A8_UNORM
R16G16B16A16
Y8_UNORM

Value	Name	Description
00b		4-tap filter is only done on all channels.
01b		Enable 8-tap Adaptive filter on G-channel. 4-tap filter on other channels.
10b		8-tap filter is done on all channels (UV-ch uses the Y-coefficients)
11b		Enable 8-tap Adaptive filter all channels (UV-ch uses the Y-coefficients).

Programming Notes

For 00 and 10, are applicable for RGB surfaces only or surface without Y-ch.
In case it is a YUV surface it will default to adaptive mode automatically which is 01 and 11 respectively. Alpha channel is always bi-linear filter irrespective of the above modes.

Mode 01 and 00 are legacy support and are supported on all surface formats.

When Mode is 10 and Surface format is Y8_UNORM, Bypass X/Y Adaptive Filtering must be 1, and Default Sharp Level must be 255

SAMPLER_STATE

SAMPLER_STATE

Source:	BSpec
Exists If:	//(MessageType != 'Deinterlace') && (MessageType != 'Sample_8x8')
Size (in bits):	128
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000

This is the normal sampler state used by all messages that use SAMPLER_STATE except sample_8x8 and deinterlace. The sampler state is stored as an array of up to 16 elements, each of which contains the dwords described here. The start of each element is spaced 4 dwords apart. The first element of the sampler state array is aligned to a 32-byte boundary.

DWord	Bit	Description
0	31	**Sampler Disable** Format: Disable This field allows the sampler to be disabled. If disabled, all output channels will return 0.
	30	**Reserved**
	29	**Texture Border Color Mode** For some surface formats, the 32 bit border color is decoded differently based on the border color mode. In addition, the default value of channels not included in the surface may be affected by this field. Refer to the "Sampler Output Channel Mapping" table for the values of these channels, and for surface formats that may only support one of these modes. Also refer to the definition of SAMPLER_BORDER_COLOR_STATE for more details on the behavior of the two modes defined by this field.

Value	Name	Description
0h	DX10/OGL	DX10/OGL mode for interpreting the border color
1h	DX9	DX9 and earlier mode for interpreting the border color

Programming Notes
This feild must not be set to DX9 if there are null tiles in use
This field is required to be the same for every message over a period of time. A flush of the sampler cache must occur before a message with the opposite state of this field is delivered.
This field must be set to DX9 mode when used with surfaces that have Surface Format P4A4_UNORM or A4P4_UNORM.
This field must be set to DX10/OGL mode when used with surfaces that have Surface Format YCRCB_SWAPUV or YCRCB_SWAPY.
This field must be set to DX10/OGL mode if **Surface Format** for the associated surface is UINT OR SINT.
This field must be set to DX10/OGL mode if REDUCTION_MINIMUM or REDUCTION_MAXIMUM or message type is sample_min or sample_max.

SAMPLER_STATE

28:27 **LOD PreClamp Mode**

This field determines whether the computed LOD is clamped to [max,min] mip level before the mag-vs-min determination is performed.
PRECLAMP_OGL: LOD pre-clamped to **Min LOD** and **Max LOD**
OpenGL API currently clamps LOD to the **Min LOD** and **Max LOD** (from Sampler State) prior to performing min/mag determination, and therefore it is expected that an OpenGL driver would need to set this field to PRECLAMP_OGL.

Value	Name	Description
0h	NONE	LOD PreClamp disabled
1h	Reserved	
2h	OGL	LOD PreClamp enabled (OGL mode)

26:22 **Coarse LOD Quality Mode**

Format:	U5

This field configures the coarse LOD image quality mode for the sample_d, sample_l, and sample_b messages in the sampling engine. In general, performance will increase and power consumption will decrease with each step of reduced quality (performance gain for sample_l and sample_b will be minimal).

Value	Name	Description
0h	Disabled	Full quality is enabled, matching prior products
01h-1Fh		Quality degrades with each larger value, performance improves with each larger value

Programming Notes
Although allowed, it is not recommended to program this field to a value greater than 17h to avoid masking the exponent which may generate incorrect LOD values.

21:20 **Mip Mode Filter**

Format:	U2 Enumerated Type

This field determines if and how mip map levels are chosen and/or combined when texture filtering.

Value	Name	Description
0h	NONE	Disable mip mapping - force use of the mipmap level corresponding to Min LOD.
1h	NEAREST	Nearest, Select the nearest mip map
2h	Reserved	
3h	LINEAR	Linearly interpolate between nearest mip maps (combined with linear min/mag filters this is analogous to "Trilinear" filtering).

Programming Notes

SAMPLER_STATE

		MIPFILTER_LINEAR is not supported for surface formats that do not support "Sampling Engine Filtering" as indicated in the Surface Formats table unless using the sample_c message type or minimum/maximum operation.
		Mip Mode Filter must be set to MIPFILTER_NONE or MIPFILTER_NEAREST if Surface Format for the associated surface is UINT or SINT. However, all settings of this field are allowed with UINT/SINT if a minimum or maximum operation is being performed.
		Mip Mode Filter must be set to MIPFILTER_NONE for Planar YUV surfaces.
	19:17	**Mag Mode Filter** Format: U3 Enumerated Type This field determines how texels are sampled/filtered when a texture is being "magnified" (enlarged). For volume maps, this filter mode selection also applies to the 3rd (inter-layer) dimension.

Value	Name	Description
0h	NEAREST	Sample the nearest texel
1h	LINEAR	Bilinearly filter the 4 nearest texels
2h	ANISOTROPIC	Perform an "anisotropic" filter on the chosen mip level
4h-5h	Reserved	
6h	MONO	Perform a monochrome convolution filter
7h	Reserved	

Programming Notes
Only MAPFILTER_NEAREST and MAPFILTER_LINEAR are supported for surfaces of type SURFTYPE_3D.
Only MAPFILTER_NEAREST is supported for surface formats that do not support "Sampling Engine Filtering" as indicated in the Surface Formats table unless using the sample_c message type or minimum/maximum operation.
MAPFILTER_MONO: Only CLAMP_BORDER texture addressing mode is supported. . Both Mag Mode Filter and Min Mode Filter must be programmed to MAPFILTER_MONO. Mip Mode Filter must be MIPFILTER_NONE. Only valid on surfaces with Surface Format MONO8 and with Surface Type SURFTYPE_2D.
MAPFILTER_ANISOTROPIC may cause artifacts at cube edges if enabled for cube maps with the TEXCOORDMODE_CUBE addressing mode.
MAPFILTER_ANISOTROPIC will be overridden to MAPFILTER_LINEAR when using a sample_l or sample_l_c message type or when Force LOD to Zero is set in the message header.
Both Mag Mode Filter and Min Mode Filter must be set to MAPFILTER_NEAREST if Surface Format for the associated surface is UINT or SINT. However, all settings of this field other than MAPFILTER_MONO are allowed with UINT/SINT if a minimum or maximum operation is being performed.

SAMPLER_STATE

16:14 Min Mode Filter

Format:	U3 Enumerated Type

This field determines how texels are sampled/filtered when a texture is being "minified" (shrunk). For volume maps, this filter mode selection also applies to the 3rd (inter-layer) dimension.See Mag Mode Filter

Value	Name	Description
0h	NEAREST	Sample the nearest texel
1h	LINEAR	Bilinearly filter the 4 nearest texels
2h	ANISOTROPIC	Perform an "anisotropic" filter on the chosen mip level
4h-5h	Reserved	
6h	MONO	Perform a monochrome convolution filter
7h	Reserved	

13:1 Texture LOD Bias

Format:	S4.8 2's complement

Range: [-16.0, 16.0)

This field specifies the signed bias value added to the calculated texture map LOD prior to min-vs-mag determination and mip-level clamping. Assuming mipmapping is enabled, a positive LOD bias will result in a somewhat blurrier image (using less-detailed mip levels) and possibly higher performance, while a negative bias will result in a somewhat crisper image (using more-detailed mip levels) and may lower performance.

Programming Notes

There is no requirement or need to offset the LOD Bias in order to produce a correct LOD for texture filtering (as was required for correct bilinear and anisotropic filtering in some legacy devices).

0 LOD algorithm

Format:	U1 Enumerated Type

Controls which algorithm is used for LOD calculation. Generally, the EWA approximation algorithm results in higher image quality than the legacy algorithm.

Value	Name	Description
0h	LEGACY	Use the legacy algorithm for anisotropic filtering
1h	EWA Approximation	Use the new EWA approximation algorithm for anisotropic filtering

1 31:20 Min LOD

Format:	U4.8 in LOD units

Range: [0.0, 14.0], where the upper limit is also bounded by the Max LOD.

This field specifies the minimum value used to clamp the computed LOD after LOD bias is applied. Note that the minification-vs.-magnification status is determined after LOD bias and

SAMPLER_STATE

before this maximum (resolution) mip clamping is applied.The integer bits of this field are used to control the "maximum" (highest resolution) mipmap level that may be accessed (where LOD 0 is the highest resolution map). The fractional bits of this value effectively clamp the inter-level trilinear blend factor when trilinear filtering is in use.

Programming Notes

If Min LOD is greater than Max LOD, Min LOD takes precedence, i.e. the resulting LOD will always be Min LOD.

This field must be zero if the Min or Mag Mode Filter is set to MAPFILTER_MONO

19:8 **Max LOD**

Format:	U4.8 in LOD units

Range: [0.0, 14.0]

This field specifies the maximum value used to clamp the computed LOD after LOD bias is applied. Note that the minification-vs.-magnification status is determined after LOD bias and before this minimum (resolution) mip clamping is applied.The integer bits of this field are used to control the "minimum" (lowest resolution) mipmap level that may be accessed.The fractional bits of this value effectively clamp the inter-level trilinear blend factor when trilinear filtering is in use.Force the mip map access to be between the mipmap specified by the integer bits of the Min LOD and the ceiling of the value specified here.

7 **ChromaKey Enable**

Format:	Enable This field enables the chroma key function.

Programming Notes

Supported only on a specific subset of surface formats. See section titled: "Surface Formats" in thsi volume for supported formats.
This field must be disabled if min or mag filter is MAPFILTER_MONO or MAPFILTER_ANISOTROPIC.
This field must be disabled if used with a surface of type SURFTYPE_3D.

6:5 **ChromaKey Index**

Format:	U2

Range: [0, 3]

This field specifies the index of the ChromaKey Table entry associated with this Sampler. This field is a "don't care" unless **ChromaKey Enable** is ENABLED.

4 **ChromaKey Mode**

Format:	U1 Enumerated Type

This field specifies the behavior of the device in the event of a ChromaKey match. This field is ignored if ChromaKey is disabled.

SAMPLER_STATE

KEYFILTER_REPLACE_BLACK:
In this mode, each texel that matches the chroma key is replaced with (0,0,0,0) (black with alpha=0) prior to filtering. For YCrCb surface formats, the black value is A=0, R(Cr)=0x80, G(Y)=0x10, B(Cb)=0x80. This will tend to darken/fade edges of keyed regions. Note that the pixel pipeline must be programmed to use the resulting filtered texel value to gain the intended effect, e.g., handle the case of a totally keyed-out region (filtered texel alpha==0) through use of alpha test, etc.

Value	Name	Description
0h	KEYFILTER_KILL_ON_ANY_MATCH	In this mode, if any contributing texel matches the chroma key, the corresponding pixel mask bit for that pixel is cleared. The result of this operation is observable only if the Killed Pixel Mask Return flag is set on the input message.
1h	KEYFILTER_REPLACE_BLACK	In this mode, each texel that matches the chroma key is replaced with (0,0,0,0) (black with alpha=0) prior to filtering. For YCrCb surface formats, the black value is A=0, R(Cr)=0x80, G(Y)=0x10, B(Cb)=0x80. This will tend to darken/fade edges of keyed regions. Note that the pixel pipeline must be programmed to use the resulting filtered texel value to gain the intended effect, e.g., handle the case of a totally keyed-out region (filtered texel alpha==0) through use of alpha test, etc.

3:1 **Shadow Function**

Format:	U3 Enumerated Type

This field is used for shadow mapping support via the sample_c message type, and specifies the specific comparison operation to be used. The comparison is between the texture sample red channel (except for alpha-only formats which use the alpha channel), and the "ref" value provided in the input message.

Value	Name
0h	PREFILTEROP ALWAYS
1h	PREFILTEROP NEVER
2h	PREFILTEROP LESS
3h	PREFILTEROP EQUAL
4h	PREFILTEROP LEQUAL
5h	PREFILTEROP GREATER
6h	PREFILTEROP NOTEQUAL
7h	PREFILTEROP GEQUAL

SAMPLER_STATE

	0	**Cube Surface Control Mode** Format: U1 Enumerated Type When sampling from a SURFTYPE_CUBE surface, this field controls whether the TC* Address Control Mode fields are interpreted as programmed or overridden to TEXCOORDMODE_CUBE. **Value** / **Name** 0h PROGRAMMED 1h OVERRIDE **Programming Notes** This field must be set to CUBECTRLMODE_PROGRAMMED
2	31:30	**Reserved**
	29:28	**Reserved**
	27:26	**Reserved**
	31:24	**Reserved**
	25:24	**Reserved**
	23:6	**Indirect State Pointer** **Description** This pointer is relative to the Dynamic State Base Address.
	5	**Reserved** Format: MBZ
	4	**Reserved**
	3	**Reserved**
	2	**Reserved**
	1	**Reserved**
	0	**LOD Clamp Magnification Mode** Format: U1 Enumerated Type This field allows the flexibility to control how LOD clamping is handled when in magnification mode. **Value** / **Name** / **Description** 0h MIPNONE When in magnification mode, Sampler will clamp LOD as if the **Mip Mode Filter** is MIPFILTER_NONE. This is how OpenGL defines magnification, and therefore it is expected that those drivers would not set this bit. 1h MIPFILTER When in magnification mode, Sampler will clamp LOD based on the value of **Mip Mode Filter**.
3	31:24	**Reserved**
	25:24	**Reserved** Format: MBZ

SAMPLER_STATE

23:22 **Reduction Type**

Format:	U2 Enumerated Type

This field defines the type of reduction that will be performed on the texels in the footprint defined by the **Min/Mag/Mip Filter Mode** fields. This field is ignored if **Reduction Type Enable** is disabled.

Value	Name	Description
0h	STD_FILTER	standard filter
1h	COMPARISON	comparison followed by standard filter
2h	MINIMUM	minimum of footprint
3h	MAXIMUM	maximum of footprint

Programming Notes
The following message types ignore this field: *sample_min, sample_max, sample_unorm*, resinfo, sampleinfo, LOD, ld*, sample_8x8*.
If the current min/mag filter mode is MAPFILTER_MONO, this field is ignored.
The *sample_c, sample_l_c, sample_d_c, sample_b_c, gather4_c*, and *gather4_po_c* message types, when used with STD_FILTER, MINIMUM, or MAXIMUM settings of this field, perform the operation of the message of the same name without the "_c". The ref parameter is ignored by hardware.
For message types not listed above, when used with COMPARISON setting of this field, perfom the operation of the message of the same name with "_c" included. The ref parameter used by the operation (since it is not delivered in the message) is set to zero.
Restrictions applying to the message whose behavior is being performed must be followed. For example, a sample message used with COMPARISON reduction filter must follow all of the restrictions of *sample_c*. An exception to this is the MINIMUM and MAXIMUM reduction types allow SURFTYPE_1D, 2D, 3D, and CUBE, including with **Surface Array** enabled, even though the sample_min/max messages only allow 2D.
Restrictions applying to the message delivered need not be followed. For example, a *sample_c* message used with STD_FILTER reduction filter needs to follow only the restrictions of sample, not the restrictions of *sample_c*.

21:19 **Maximum Anisotropy**

Format:	U3 Enumerated Type

This field clamps the maximum value of the anisotropy ratio used by the MAPFILTER_ANISOTROPIC filter (Min or Mag Mode Filter).

Value	Name	Description
0h	RATIO 2:1	At most a 2:1 aspect ratio filter is used
1h	RATIO 4:1	At most a 4:1 aspect ratio filter is used
2h	RATIO 6:1	At most a 6:1 aspect ratio filter is used
3h	RATIO 8:1	At most a 8:1 aspect ratio filter is used

SAMPLER_STATE

4h	RATIO 10:1	At most a 10:1 aspect ratio filter is used
5h	RATIO 12:1	At most a 12:1 aspect ratio filter is used
6h	RATIO 14:1	At most a 14:1 aspect ratio filter is used
7h	RATIO 16:1	At most a 16:1 aspect ratio filter is used

18 **U Address Mag Filter Rounding Enable**

Format:	Enable

Controls whether the texture address is rounded or truncated before being used to select texels to sample. Provides independent control of rounding on one texture address dimension (U/V/R) in either mag or min filter mode.

Programming Notes

Hardware will **not** force rounding enable.

17 **U Address Min Filter Rounding Enable**

Format:	Enable

Controls whether the texture address is rounded or truncated before being used to select texels to sample. Provides independent control of rounding on one texture address dimension (U/V/R) in either mag or min filter mode.

Programming Notes

Hardware will **not** force rounding enable.

16 **V Address Mag Filter Rounding Enable**

Format:	Enable

Controls whether the texture address is rounded or truncated before being used to select texels to sample. Provides independent control of rounding on one texture address dimension (U/V/R) in either mag or min filter mode.

Programming Notes

Hardware will **not** force rounding enable.

15 **V Address Min Filter Rounding Enable**

Format:	Enable

Controls whether the texture address is rounded or truncated before being used to select texels to sample. Provides independent control of rounding on one texture address dimension (U/V/R) in either mag or min filter mode.

Programming Notes

Hardware will **not** force rounding enable.

14 **R Address Mag Filter Rounding Enable**

Format:	Enable

Controls whether the texture address is rounded or truncated before being used to select texels to sample. Provides independent control of rounding on one texture address dimension (U/V/R) in either mag or min filter mode.

Programming Notes

SAMPLER_STATE

	Hardware will **not** force rounding enable.
13	**R Address Min Filter Rounding Enable** Format: Enable Controls whether the texture address is rounded or truncated before being used to select texels to sample. Provides independent control of rounding on one texture address dimension (U/V/R) in either mag or min filter mode. **Programming Notes** Hardware will **not** force rounding enable.
12:11	**Trilinear Filter Quality** Format: U2 Enumerated Type Selects the quality level for the trilinear filter.

Value	Name	Description
0	FULL	Full Quality. Both mip maps are sampled under all circumstances.
1	TRIQUAL_HIGH/MAG_CLAMP_MIPFILTER	High Quality. Same as full quality. When in magnification mode, Sampler will clamp LOD based on the value of **Mip Mode Filter**. If LOD values which are within 12.5% of an integer LOD value are rounded to that value prior to filtering and filtering effectively becomes the same as MIP Nearest.
2	MED	Medium Quality. If the contribution of one mip map is less than 25%, only the other mip map contributes. If LOD values which are within 16.67% of an integer LOD value are rounded to that value prior to filtering and filtering effectively becomes the same as MIP Nearest.
3	LOW	Low Quality. If the contribution of one mip map is less than 37.5%, only the other mip map contributes.p

10	**Non-normalized Coordinate Enable** Format: Enable This field, if enabled, specifies that the input coordinates (U/V/R) are in non-normalized space, where each integer increment is one texel on LOD 0. If disabled, coordinates are normalized, where the range 0 to 1 spans the entire surface. **Programming Notes** The following state must be set as indicated if this field is *enabled*: • TCX/Y/Z Address Control Mode must be TEXCOORDMODE_CLAMP, TEXCOORDMODE_HALF_BORDER, or TEXCOORDMODE_CLAMP_BORDER.

SAMPLER_STATE

- Surface Type must be SURFTYPE_2D or SURFTYPE_3D.
- Mag Mode Filter must be MAPFILTER_NEAREST or MAPFILTER_LINEAR.
- Min Mode Filter must be MAPFILTER_NEAREST or MAPFILTER_LINEAR.
- Mip Mode Filter must be MIPFILTER_NONE.
- Min LOD must be 0.
- Max LOD must be 0.
- MIP Count must be 0.
- Surface Min LOD must be 0.
- Texture LOD Bias must be 0.

9 **Reduction Type Enable**

Format:	Enable

This field enables the **Reduction Type** field to modify the behavior of messages based on its setting. If this field is disabled, all messages behave as defined and the **Reduction Type** field is ignored.

8:6 **TCX Address Control Mode**

Format:	**Texture Coordinate Mode** Enumerated Type

Controls how the 1st (TCX, aka U) component of input texture coordinates are mapped to texture map addresses - specifically, how coordinates "outside" the texture are handled (wrap/clamp/mirror). The setting of this field is subject to being overridden by the Cube Surface Control Mode field when sampling from a SURFTYPE_CUBE surface.

Programming Notes
When using cube map texture coordinates, each TC component must have the same Address Control Mode.
When TEXCOORDMODE_CUBE is not used accessing a cube map, the map's Cube Face Enable field must be programmed to 111111b (all faces enabled).
MAPFILTER_MONO: Texture addressing modes must all be set to TEXCOORDMODE_CLAMP_BORDER. The **Border Color** is ignored in this mode, a constant value of 0 is used for border color. Software must pad the border texels within the map itself with 0.
If **Surface Format** is PLANAR*, this field must be set to TEXCOORDMODE_CLAMP.

5:3 **TCY Address Control Mode**

Format:	**Texture Coordinate Mode** Enumerated Type

Controls how the 2nd (TCY, aka V) component of input texture coordinates are mapped to texture map addresses - specifically, how coordinates "outside" the texture are handled (wrap/clamp/mirror). See Address TCX Control Mode above for details

Programming Notes
If this field is set to TEXCOORDMODE_CLAMP_BORDER or TEXCOORDMODE_HALF_BORDER and a 1D surface is sampled, incorrect blending with the border color in the vertical direction may occur.

SAMPLER_STATE		
	2:0	**TCZ Address Control Mode** Format: **Texture Coordinate Mode** Enumerated Type Controls how the 3rd (TCZ) component of input texture coordinates are mapped to texture map addresses - specifically, how coordinates "outside" the texture are handled (wrap/clamp/mirror).See Address TCX Control Mode above for details

SCISSOR_RECT

SCISSOR_RECT

Source: RenderCS

Size (in bits): 64

Default Value: 0x00000000, 0x00000000

The viewport-specific state used by the SF unit (SCISSOR_RECT) is stored as an array of up to 16 elements, each of which contains the DWords described below. The start of each element is spaced 2 DWords apart. The location of first element of the array, as specified by Pointer to SCISSOR_RECT, is aligned to a 32-byte boundary.

DWord	Bit	Description
0	31:16	**Scissor Rectangle Y Min** Format: U16 Pixels from Drawing Rectangle origin (upper left corner) Specifies Y Min coordinate of (inclusive) Scissor Rectangle used for scissor test. Pixels with (Draw Rectangle-relative) Y coordinates less than Y Min will be clipped out if Scissor Rectangle is enabled. NOTE: If Y Min is set to a value greater than Y Max, all primitives will be discarded for this viewport. Value: [0,16383] — Name:
	15:0	**Scissor Rectangle X Min** Format: U16 Pixels from Drawing Rectangle origin (upper left corner) Specifies X Min coordinate of (inclusive) Scissor Rectangle used for scissor test. Pixels with (Draw Rectangle-relative) X coordinates less than X Min will be clipped out if Scissor Rectangle is enabled. NOTE: If X Min is set to a value greater than X Max, all primitives will be discarded for this viewport. Value: [0,16383] — Name:
1	31:16	**Scissor Rectangle Y Max** Format: U16 Pixels from Drawing Rectangle origin (upper left corner) Specifies Y Max coordinate of (inclusive) Scissor Rectangle used for scissor test. Pixels with (Draw Rectangle-relative) Y coordinates greater than Y Max will be clipped out if Scissor Rectangle is enabled. Value: [0,16383] — Name:
	15:0	**Scissor Rectangle X Max** Format: U16 Pixels from Drawing Rectangle origin (upper left corner) Specifies X Max coordinate of (inclusive) Scissor Rectangle used for scissor test. Pixels with (Draw Rectangle-relative) Y coordinates greater than X Max will be clipped out if Scissor Rectangle is enabled. Value: 0-16383 — Name:

Scratch Hword Block Message Header

MH_A32_HWB - Scratch Hword Block Message Header

Source: DataPort 0

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0..2	95:0	**Reserved** Format: Ignore Ignored
3	31:0	**Per Thread Scratch Space** Format: MHC_PTSS Specifies amount of scratch space used by this thread, for Stateless bounds checking.
4	31:0	**Reserved** Format: Ignore Ignored
5	31:0	**Buffer Base Address** Format: MHC_A32_BBA Specifies the surface address offset page [31:10] for A32 stateless messages.
6..7	63:0	**Reserved** Format: Ignore Ignored

DWord	**Bit**	**Description**
0	31:0	**Viewport Matrix Element m00** Format: IEEE_Float
1	31:0	**Viewport Matrix Element m11** Format: IEEE_Float
2	31:0	**Viewport Matrix Element m22** Format: IEEE_Float
3	31:0	**Viewport Matrix Element m30** Format: IEEE_Float
4	31:0	**Viewport Matrix Element m31** Format: IEEE_Float
5	31:0	**Viewport Matrix Element m32** Format: IEEE_Float
6	31:0	**Reserved** Format: MBZ
7	31:0	**Reserved** Format: MBZ
8	31:0	**X Min Clip Guardband** Format: IEEE_Float . This 32-bit float represents the XMin guardband boundary (normalized to Viewport.XMin == -1.0f). This corresponds to the left boundary of the NDC guardband.
9	31:0	**X Max Clip Guardband** Format: IEEE_Float This 32-bit float represents the XMax guardband boundary (normalized to Viewport..XMax == 1.0f). This corresponds to the right boundary of the NDC guardband.

SF_CLIP_VIEWPORT

10	31:0	**Y Min Clip Guardband** Format: IEEE_Float This 32-bit float represents the YMin guardband boundary (normalized to Viewport.YMin == -1.0f). This corresponds to the bottom boundary of the NDC guardband.
11	31:0	**Y Max Clip Guardband** Format: IEEE_Float This 32-bit float represents the YMax guardband boundary (normalized to Viewport.YMax == 1.0f). This corresponds to the top boundary of the NDC guardband.
12	31:0	**X Min ViewPort** Format: IEEE_Float This 32-bit float represents the Viewport.XMin. This is the X min of the viewport extents as programmed by API, and this value should be programmed in Screen Space coordinate and not as normalized coordinate.
13	31:0	**X Max ViewPort** Format: IEEE_Float This 32-bit float represents the Viewport.XMax. This is the X max of the viewport extents as programmed by API, and this value should be programmed in Screen Space coordinate and not as normalized coordinate.
14	31:0	**Y Min ViewPort** Format: IEEE_Float This 32-bit float represents the Viewport.YMin. This is the Y min of the viewport extents as programmed by API, and this value should be programmed in Screen Space coordinate and not as normalized coordinate.
15	31:0	**Y Max ViewPort** Format: IEEE_Float This 32-bit float represents the Viewport.Ymax. This is the Y max of the viewport extents as programmed by API, and this value should be programmed in Screen Space coordinate and not as normalized coordinate.

SF_OUTPUT_ATTRIBUTE_DETAIL

SF_OUTPUT_ATTRIBUTE_DETAIL		
Source:	RenderCS	
Size (in bits):	16	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	15	**Component Override W** Format: Enable If set, the W component of this output Attribute is overridden by the W component of the constant vector specified by ConstantSource.
	14	**Component Override Z** Format: Enable If set, the Z component of this output Attribute is overridden by the Z component of the constant vector specified by ConstantSource.
	13	**Component Override Y** Format: Enable If set, the Y component of output Attribute is overridden by the Y component of the constant vector specified by ConstantSource.
	12	**Component Override X** Format: Enable If set, the X component of output Attribute is overridden by the X component of the constant vector specified by ConstantSource.
	11	**Swizzle Control Mode** Format: U1 Enumerated Type When Attribute Swizzle Enable is ENABLED, this bit controls whether attributes 0-15 or 16-31 are subject to the following swizzle controls: • Component Override X/Y/Z/W • Constant Source • Swizzle Select • Source Attribute • WrapShortest Enables Note that the Number of SF Output Attributes field specifies how many attributes are output. Note: This field does not impact any functions which provide separate states for all 32 attributes (e.g., Point sprite, Constant interpolation). Note: This field is only valid for the first indexed attribute (Attribute[0]). For all other indices, it is Reserved and MBZ.

SF_OUTPUT_ATTRIBUTE_DETAIL

10:9 Constant Source

Format:	U2 enumerated type

This state selects a constant vector which can be used to override individual components of this Attribute

Value	Name	Description
0h	CONST_0000	Constant.xyzw = 0.0,0.0,0.0,0.0
1h	CONST_0001_FLOAT	Constant.xyzw = 0.0,0.0,0.0,1.0
2h	CONST_1111_FLOAT	Constant.xyzw = 1.0,1.0,1.0,1.0
3h	PRIM_ID	Constant.xyzw = PrimID (replicated)

8 Reserved

Format:	MBZ

7:6 Swizzle Select

Format:	U2 enumerated type

This state, along with Source Attribute, specifies the source for this output Attribute.

Value	Name	Description
0h	INPUTATTR	This attribute is sourced from AttrInputReg[SourceAttribute]
1h	INPUTATTR_FACING	If the object is front-facing, this attribute is sourced from AttrInputReg[SourceAttribute]. If the object is back-facing, this attribute is sourced from AttrInputReg[SourceAttribute+1].
2h	INPUTATTR_W	This attribute is sourced from AttrInputReg[SourceAttribute]. The W component is copied to the X component.
3h	INPUTATTR_FACING_W	If the object is front-facing, this attribute is sourced from AttrInputReg[SourceAttribute]. If the object is back-facing, this attribute is sourced from AttrInputReg[SourceAttribute+1]. The W component is copied to the X component.

5 Reserved

Format:	MBZ

4:0 Source Attribute

Format:	U5

This field selects the source attribute for this Attribute. Source attribute 0 corresponds to the first 128 bits of data indicated by Vertex URB Entry Read Offset

0	1:0	**SIMD Mode** Format: Enumeration Specifies the SIMD mode of the message (number of slots processed)

Value	Name	Description
00h	SIMD4x2	SIMD4x2
01h	SIMD16	SIMD16
02h	SIMD8	SIMD8
03h	Reserved	Ignored

SLM Surface Pixel Mask Message Header

MH1_SLM_PSM - SLM Surface Pixel Mask Message Header

Source: DataPort 1

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x0000FFFF

DWord	Bit	Description
0..6	223:0	**Reserved** Format: Ignore Ignored
7	31:0	**Pixel Sample Mask** Format: MHC_PSM Specifies the 16-bit Pixel/Sample Mask used with SIMD16 and SIMD8 surfaces.

Slot Group 2 Message Descriptor Control Field

MDC_SG2 - Slot Group 2 Message Descriptor Control Field

Source: BSpec
Size (in bits): 1
Default Value: 0x00000000

DWord	Bit	Description
0	0	**SIMD Mode** Format: Enumeration Controls which 8 bits of Pixel/Sample Mask in the message header are ANDed with the execution mask to determine which slots are accessed. This field is ignored if the header is not present. Value / Name / Description 00h / SG8L / Use low 8 slots 01h / SG8U / Use high 8 slots

Slot Group 3 Message Descriptor Control Field

MDC_SG3 - Slot Group 3 Message Descriptor Control Field

Source: BSpec
Size (in bits): 2
Default Value: 0x00000000

DWord	Bit	Description
0	1:0	**SIMD Mode** Format: Enumeration Controls which 8 bits of Pixel/Sample Mask in the message header are ANDed with the execution mask to determine which slots are accessed. This field is ignored if the header is not present.

Value	Name	Description
00h	SG4x2	SIMD4x2
01h	SG8L	Use low 8 slots
02h	SG8U	Use high 8 slots
03h	Reserved	Ignored

Slot Group Select Render Cache Message Descriptor Control Field

MDC_RT_SGS - Slot Group Select Render Cache Message Descriptor Control Field

Source: BSpec
Size (in bits): 1
Default Value: 0x00000000

DWord	Bit	Description
0	0	**Slot Group Select** This field selects whether slots 15:0 or slots 31:16 are used for bypassed data. Bypassed data includes the antialias alpha, multisample coverage mask, and if the header is not present also includes the X/Y addresses and pixel enables. For 8- and 16-pixel dispatches, SLOTGRP_LO must be selected on every message. For 32-pixel dispatches, this field must be set correctly for each message based on which slots are currently being processed.

Value	Name	Description
00h	SLOTGRP_LO	Choose bypassed data for slots 15:0
01h	SLOTGRP_HI	Choose bypassed data for slots 31:16

SO_DECL

SO_DECL

Source: RenderCS

Size (in bits): 16

Default Value: 0x00000000

A list of SO_DECL structures are passed in the 3DSTATE_SO_DECL_LIST command. Each structure specifies either (a) the source and destination of an up-to-4-DWord appending write into an SO buffer, or (b) how many DWords to skip over in the destination SO buffer (i.e., a "hole" where the previous buffer contents are maintained).

DWord	Bit	Description
0	15:14	**Reserved** Format: MBZ
	13:12	**Output Buffer Slot** Format: U2 Buffer Index This field selects the destination output buffer slot.
	11	**Hole Flag** Format: Flag If set, the Component Mask field indirectly specifies a number of 32-bit locations to skip over (leave unmodified in memory) in the selected output buffer. The Register Index field is ignored. The only permitted Component Mask values are as follows: 0x0 No Dwords are skipped over (SO_DECL performs no operation) 0x1 (X) Skip 1 DWord 0x3 (XY) Skip 2 DWords 0x7 (XYZ) Skip 3 DWords 0xF (XYZW) Skip 4 DWords
	10	**Reserved** Format: MBZ
	9:4	**Register Index** Format: U6 128-bit granular offset into the source vertex read data If Hole Flag is clear, this field specifies the 128-bit offset into the source vertex data which supplies the source data to be written to the destination buffer, where the individual 32-component destination locations are selected by Component Mask. e.g., Register Index 0 corresponds with the first 128 bits of the data read from the vertex URB entry (as per corresponding Vertex Read Offset state) There is only enough internal storage for the 128-bit vertex header and 32 128-bit vertex attributes.

SO_DECL

Value	Name
[0,32]	
0h	**[Default]**

Programming Notes
It is the responsibility of software to map any API-visible source data specifications (e.g., vertex register number) into 128-bit granular URB read offsets.

3:0 **Component Mask**

Format:	MASK 4-bit Mask

This field is a 4-bit bitmask that selects which contiguous 32-bit component(s) are either written or skipped-over in the destination buffer.

If this field is zero the SO_DECL operation is effectively a no-op. No data will be appended to the destination and the destination buffer's write pointer will not be advanced.

If the **Hole Flag** is set, this field (if non-zero) indirectly specifies how much the destination buffer's write pointer should be advanced.See **Hole Flag** description above for restrictions on this field.

If the **Hole Flag** is clear, this field (if non-zero) selects which source components are to be written to the destination buffer. The components must be contiguous, e.g. YZW is legal, but XZW is not. The selected source components are written to the destination buffer starting at the current write pointer, and then the write pointer is advanced past the written data. E.g., if YZW is specified, the three (YZW) components of the source register will be written to the destination buffer at the current write pointer, and the write pointer will be advanced by 3 DWords.

Value	Name
0h	**[Default]**
xxx1b	SO_DECL_COMPMASK_X
xx1xb	SO_DECL_COMPMASK_Y
x1xxb	SO_DECL_COMPMASK_Z

Specifies a 64-bit (48-bit canonical) 64-byte aligned memory base address.		
DWord	**Bit**	**Description**
0..1	63:6	**Base Address** Format: GraphicsAddress63-6
	5:0	**Base Address High** Format: MBZ

SrcRegNum

SrcRegNum

Source: Eulsa

Size (in bits): 8

Default Value: 0x00000000

Description

Register Number
The register number for the operand. For a GRF register, is the part of a register address that aligns to a 256-bit (32-byte) boundary. For an ARF register, this field is encoded such that MSBs identify the architecture register type and LSBs provide the register number.
An ARF register can only be dst or src0. Any src1 or src2 operands cannot be ARF registers.
RegNum and SubRegNum together provide the byte-aligned address for the origin of a register region. RegNum provides bits 12:5 of that address. For one-source and two-source instructions, SubregNum provides bits 4:0. For three-source instructions, the address must be DWord-aligned; SubRegNum provides bits 4:2 of the address and bits 1:0 are zero.
This field is present for the direct addressing mode and not present for indirect addressing.
This field applies to both source and destination operands.

DWord	Bit	Description
0	7:0	**Source Register Number**

Value	Name	Description
0-127	If {Dst/Src0/Src1/Src2}.RegFile==GRF	
0-0ffh	If {Dst/Src0/Src1/Src2}.RegFile==ARF	This field is used to encode the architecture register as well as providing the register number. See GEN Execution Environment chapter for details.

SrcSubRegNum

SrcSubRegNum

Source:	Eulsa
Size (in bits):	5
Default Value:	0x00000000

Description

Subregister Number
The subregister number for the operand. For a GRF register, is the byte address within a 256-bit (32-byte) register. For an ARF register, determines the sub-register number according to the specified encoding for the given architecture register.
RegNum and SubRegNum together provide the byte-aligned address for the origin of a GRF register region. RegNum provides bits 12:5 of that address. For one-source and two-source instructions, SubregNum provides bits 4:0. For three-source instructions, the address must be DWord-aligned; SubRegNum provides bits 4:2 of the address and bits 1:0 are zero.

Programming Notes

Note: The recommended instruction syntax uses subregister numbers within the GRF in units of actual data element size, corresponding to the data type used. For example for the F (Float) type, the assembler syntax uses subregister numbers 0 to 7, corresponding to subregister byte addresses of 0 to 28 in steps of 4, the element size.

DWord	Bit	Description
0	4:0	**Source Sub Register Number**

Value	Name	Description
0-31	If {Dst/Src0/Src1/Src2}.RegFile==GRF	
0-0ffh	If {Dst/Src0/Src1/Src2}.RegFile==ARF	This field is used to encode the architecture register as well as providing the register number. See GEN Execution Environment chapter for details.

SRD Interrupt Bit Definition

SRD Interrupt Bit Definition		
Source:	BSpec	
Size (in bits):	32	
Default Value:	0x00000000	
The SRD Interrupt Registers all share the same bit definitions from this table.

	7:4	**Reserved**
	3	**Push Done EDP** This event occurs after double buffer update or Push done. After this interrupt, Logic is ready to receive another push frame indication.
	3	**Reserved**
	2	**SRD_Aux_Error_EDP** This event occurs on the rising edge of the SRD Aux error (receive error or timeout) indication.
	1	**SRD_Exit_EDP** This event occurs on the first blank start after SRD exit on transcoder EDP.
	0	**SRD_PreWarn_EDP** This event occurs two display frames prior to entering SRD on transcoder EDP.

Stateless Binding Table Index Message Descriptor Control Field

MDC_STATELESS - Stateless Binding Table Index Message Descriptor Control Field

Source: BSpec
Size (in bits): 8
Default Value: 0x000000FF

DWord	Bit	Description
0	7:0	**Binding Table Index** Format: Enumeration Specifies the message is Stateless

Value	Name	Description
0FFh	A32_A64 **[Default]**	Specifies a A32 or A64 Stateless access that is locally coherent (coherent within a thread group)
0FDh	A32_A64_NC	Specifies a A32 or A64 Stateless access that is non-coherent (coherent within a thread).
Others	Reserved	Ignored

Restriction
Restriction : When using A32_A64_NC, SW must ensure that 2 threads do not both access the same cache line (64B)

Stateless Block Message Header

MH_A32_GO - Stateless Block Message Header

Source: DataPort 0

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0..1	63:0	**Reserved** Format: MBZ Ignored
2	31:0	**Global Offset** Format: U32 Specifies the global element index into the buffer, in units of Owords, Dwords, or Bytes (depending on the message). **Programming Notes** If the address offset calculated with the Buffer Base Address and Global Offset is greater than the PTSS size or the GeneralStateBufferSize, then the access is Out-of-Bounds.
3	31:0	**Per Thread Scratch Space** Format: MHC_PTSS Specifies amount of scratch space used by this thread, for Stateless bounds checking.
4	31:0	**Reserved** Format: MBZ Ignored
5	31:0	**Buffer Base Address** Format: MHC_A32_BBA **Description** Specifies the surface address offset page [31:10] for A32 stateless messages. Restriction : When using stateless A32 Data Port messages, General State Base Address[47:12] + Buffer Base Address[31:10] must be less than 2^48. It is illegal for this to be greater or equal than 2^48.
6..7	63:0	**Reserved** Format: MBZ Ignored

Stateless Scaled Data Port 2 Message Header

MH2_A32 - Stateless Scaled Data Port 2 Message Header

Source: DataPort 2

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**Surface Pitch** Format: MHC_PITCH Specifies the 16-bit surface pitch to use with scaled A32 stateless messages.
1..4	127:0	**Reserved** Format: Ignore Ignored
5	31:2	**Buffer Base Address** Format: GeneralStateOffset[31:2] Specifies the surface address offset page [31:0] for scaled A32 stateless messages. The address must be Dword aligned (bits [1:0] = 0).
	1:0	**Reserved** Format: MBZ Ignored
6..7	63:0	**Reserved** Format: Ignore Ignored

Stateless Scaled Data Port 2 Pixel Mask Message Header

MH2_A32_PSM - Stateless Scaled Data Port 2 Pixel Mask Message Header

Source:	DataPort 2
Size (in bits):	256
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x0000FFFF

DWord	Bit	Description
0	31:0	**Surface Pitch** Format: MHC_PITCH Specifies the 16-bit surface pitch to use with scaled A32 stateless messages.
1..4	127:0	**Reserved** Format: Ignore Ignored
5	31:0	**Buffer Base Address** Format: GeneralStateOffset[31:0] Specifies the surface address offset page [31:0] for scaled A32 stateless messages. The address must be Dword aligned (bits [1:0] = 0).
6	31:0	**Reserved** Format: Ignore Ignored
7	31:0	**Pixel Sample Mask** Format: MHC_PSM Specifies the 16-bit Pixel/Sample Mask used with SIMD16 and SIMD8 untyped surfaces.

Stateless Surface Message Header

MH1_A32 - Stateless Surface Message Header		
Source:	DataPort 1	
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0..4	159:0	**Reserved** Format: Ignore Ignored
5	31:0	**Buffer Base Address** Format: MHC_A32_BBA Specifies the surface address offset page [31:10] for A32 stateless messages.
6..7	63:0	**Reserved** Format: Ignore Ignored

Stateless Surface Pixel Mask Message Header

MH1_A32_PSM - Stateless Surface Pixel Mask Message Header

Source: DataPort 1

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x0000FFFF

DWord	Bit	Description
0..4	159:0	**Reserved** Format: Ignore Ignored
5	31:0	**Buffer Base Address** Format: MHC_A32_BBA Specifies the surface address offset page [31:10] for A32 stateless messages.
6	31:0	**Reserved** Format: Ignore Ignored
7	31:0	**Pixel Sample Mask** Format: MHC_PSM Specifies the 16-bit Pixel/Sample Mask used with SIMD16 and SIMD8 surfaces.

Stencil Message Data Payload Register

MDPR_STENCIL - Stencil Message Data Payload Register

Source: BSpec

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:24	**Stencil3** Format: U8 Stencil for Slot 3.
	23:16	**Stencil2** Format: U8 Stencil for Slot 2.
	15:8	**Stencil1** Format: U8 Stencil for Slot 1.
	7:0	**Stencil0** Format: U8 Stencil for Slot 0.
1	31:24	**Stencil7** Format: U8 Stencil for Slot 7.
	23:16	**Stencil6** Format: U8 Stencil for Slot 6.
	15:8	**Stencil5** Format: U8 Stencil for Slot 5.
	7:0	**Stencil4** Format: U8 Stencil for Slot 4.

MDPR_STENCIL - Stencil Message Data Payload Register		
2..7	191:0	**Reserved** Format: Ignore Ignored

Subset Atomic Integer Trinary Operation Message Descriptor Control Field

MDC_AOP3S - Subset Atomic Integer Trinary Operation Message Descriptor Control Field

Source: BSpec
Size (in bits): 4
Default Value: 0x0000000E

DWord	Bit	Description
0	3:0	**Atomic Integer Operation Type** Format: Enumeration Specifies the atomic integer trinary operation to be performed

Value	Name	Description
0Eh	AOP_CMPWR **[Default]**	new_dst = (src0 == old_dst) ? src1 : old_dst
Others	Reserved	Ignored

Programming Notes
When Return Data Control is set, old_dst is returned.

Subset Reversed SIMD Mode 2 Message Descriptor Control Field

MDC_SM2RS - Subset Reversed SIMD Mode 2 Message Descriptor Control Field

Source:	BSpec
Size (in bits):	1
Default Value:	0x00000001

DWord	Bit	Description
0	0	**SIMD Mode** Format: Enumeration Specifies the SIMD mode of the message (number of slots processed)

Value	Name	Description
0h	Reserved	Not used
01h	SIMD8 **[Default]**	SIMD8

Subset SIMD Mode 2 Message Descriptor Control Field

MDC_SM2S - Subset SIMD Mode 2 Message Descriptor Control Field

Source: BSpec
Size (in bits): 1
Default Value: 0x00000000

DWord	Bit	Description
0	0	**SIMD Mode** Format: Enumeration Specifies the SIMD mode of the message (number of slots processed)

Value	Name	Description
00h	SIMD8	SIMD8
01h	Reserved	Ignored

Subset SIMD Mode 3 Message Descriptor Control Field

MDC_SM3S - Subset SIMD Mode 3 Message Descriptor Control Field

Source: BSpec
Size (in bits): 2
Default Value: 0x00000000

DWord	Bit	Description
0	1:0	**SIMD Mode** Format: Enumeration Specifies the SIMD mode of the message (number of slots processed)

Value	Name	Description
00h	SIMD4x2	SIMD4x2
01h	Reserved	Ignored
02h	SIMD8	SIMD8
03h	Reserved	Ignored

Subspan Render Target Message Header Control

MHC_RT_SUBSPAN - Subspan Render Target Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:16	**Y** Format: U16 Y coordinate for upper-left pixel of this subspan
	15:0	**X** Format: U16 X coordinate for upper-left pixel of this subspan

Surface Binding Table Index Message Descriptor Control Field

MDC_BTS - Surface Binding Table Index Message Descriptor Control Field

Source:	BSpec
Size (in bits):	8
Default Value:	0x00000000

DWord	Bit	Description
0	7:0	**Binding Table Index** Format: Enumeration Specifies the Binding Table index for the message, which must be a Surface State Model.

Value	Name	Description
00h-0EFh	BTS	Index of Binding Table State Surfaces
F0h-0FBh	Reserved	Reserved for future use
0FCh	SSO	Specifies a Surface State Offset supplied by the extended message descriptor
Others	Reserved	Ignored

Surface or Stateless Binding Table Index Message Descriptor Control Field

MDC_BTS_A32 - Surface or Stateless Binding Table Index Message Descriptor Control Field

Source: BSpec
Size (in bits): 8
Default Value: 0x00000000

DWord	Bit	Description
0	7:0	**Binding Table Index** Format: Enumeration Specifies the surface for the message, either Surface State Model or Stateless.

Value	Name	Description
00h-0EFh	BTS	Index of Binding Table State Surfaces
F0h-0FBh	Reserved	Reserved for future use
0FCh	SSO	Specifies a Surface State Offset supplied by the extended message descriptor
0FFh	A32_A64	Specifies a A32 or A64 Stateless access that is locally coherent (coherent within a thread group)
0FDh	A32_A64_NC	Specifies a A32 or A64 Stateless access that is non-coherent (coherent within a thread).
Others	Reserved	Ignored

Restriction
Restriction : When using A32_A64_NC, SW must ensure that 2 threads do not both access the same cache line (64B)

Surface Pitch Message Header Control

MHC_PITCH - Surface Pitch Message Header Control

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:16	**Reserved** Format: Ignore Ignored
	15:0	**Surface Pitch** Format: U16 Specifies the surface width (pitch) to be used for Stateless messages. The Surface Pitch is specified as (#items - 1). The items are specified in the message, and can be bytes, Dwords, or Qwords. The target element address offset is: BufferBaseAddress + U * (SurfacePitch+1) where U is the 32-bit element offset delivered in message address payload.

Surface Pixel Mask Message Header

MH1_BTS_PSM - Surface Pixel Mask Message Header

Source: DataPort 1

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x0000FFFF

DWord	Bit	Description
0..6	223:0	**Reserved** Format: Ignore Ignored
7	31:0	**Pixel Sample Mask** Format: MHC_PSM Specifies the 16-bit Pixel/Sample Mask used with SIMD16 and SIMD8 surfaces.

SW Generated BINDING_TABLE_STATE

SW Generated BINDING_TABLE_STATE

Source: BSpec
Size (in bits): 32
Default Value: 0x00000000

Description
The binding table binds surfaces to logical resource indices used by shaders and other compute engine kernels. It is stored as an array of up to 256 elements, each of which contains one dword as defined here. The start of each element is spaced one dword apart.
The first element of the binding table is aligned to a 64-byte boundary.
Binding table indexes beyond 256 will automatically be mapped to entry 0 by the HW, w/ the exception of any messages which support the special indexes 240 through 255, inclusive.

DWord	Bit	Description
0	31:6	**Surface State Pointer** Format: SurfaceStateOffset[31:6] This 64-byte aligned address points to a surface state block. This pointer is relative to the **Surface State Base Address**
	5	**Reserved** Format: MBZ
	4:0	**Reserved** Format: MBZ

Thread EOT Message Descriptor

TS_EOT - Thread EOT Message Descriptor

Source:	RenderCS
Size (in bits):	32
Default Value:	0x02000000

End of Thread message is sent to SFID_TS (07h) to end GPGPU and Media threads. The EU send instruction must also set the EOT control (bit 5) of the extended message descriptor.
This message is sent with single register message payload, which is a copy of the R0 thread payload sent with the thread dispatch.

DWord	Bit	Description
0	31:29	**Reserved** Format: MBZ
	28:25	**Message Length** Default Value: 1h One GRF Format: U4
	24:20	**Response Length** Default Value: 0h Zero GRF Format: U5
	19	**Header Present** Format: MBZ
	18:1	**Reserved** Format: MBZ
	0	**Message Type** Default Value: 0h End Thread Format: Opcode End of Thread message opcode

Thread Spawn Message Descriptor

Thread Spawn Message Descriptor

Source: RenderCS
Size (in bits): 32
Default Value: 0x00000000

DWord	Bit	Description
0	31:20	**Reserved** Format: MBZ
	19	**Header Present** Format: MBZ **Programming Notes** This bit MBZ for all Thread Spawner messages.
	18:5	**Reserved** Format: MBZ
	4	**Resource Select** This field specifies the resource associated with the action taken by the Opcode. Value / Name / Description / Exists If: 0 / Spawn Child / Spawn a Child Thread / [Opcode] == 'Spawn Thread' 1 / Spawn Root / Spawn a Root Thread / [Opcode] == 'Spawn Thread' 0 / Dereference Resource / The URB Handle is Dereferenced / [Opcode] == 'Dereference Resource' 1 / Keep Resource / The URBHhandle is NOT Dereferenced / [Opcode] == 'Dereference Resource'
	3:2	**Reserved** Format: MBZ
	1	**Requester Type** This field indicates whether the requesting thread is a root thread or a child thread. If it is a root thread, when Opcode is 0, FF managed resources are dereferenced. If it is a child thread and Opcode is 0, no resource is dereferenced; no action is required by the TS. Value / Name: 0 / Root Thread 1 / Child Thread
	0	**Opcode** Indicates the operation performed by the message. A root thread must terminate with a message to TS (Opcode == 0 and EOT == 1).

Thread Spawn Message Descriptor

A child thread should also terminate with such a message. A thread cannot terminate with an Opcode of "spawn thread".

Value	Name	Description
0	Dereference Resource	also used for end of thread
1	Spawn Thread	

TileW SIMD8 Data Control Dword

MDCD_TILEW - TileW SIMD8 Data Control Dword		
Source:	BSpec	
Size (in bits):	32	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	31:8	**Reserved** Format: Ignore Ignored
	7:0	**Red** Format: U8 Specifies the value of the red channel to be read or written.

TileW SIMD8 Data Payload

MDP_TILEW_SIMD8 - TileW SIMD8 Data Payload		
Source:	BSpec	
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0	31:0	**Red Slot0** Format: MDCD_TileW Specifies the Slot 0 red channel data
0.1	31:0	**Red Slot1** Format: MDCD_TileW Specifies the Slot 1 red channel data
0.2	31:0	**Red Slot2** Format: MDCD_TileW Specifies the Slot 2 red channel data
0.3	31:0	**Red Slot3** Format: MDCD_TileW Specifies the Slot 3 red channel data
0.4	31:0	**Red Slot4** Format: MDCD_TileW Specifies the Slot 4 red channel data
0.5	31:0	**Red Slot5** Format: MDCD_TileW Specifies the Slot 5 red channel data
0.6	31:0	**Red Slot6** Format: MDCD_TileW Specifies the Slot 6 red channel data
0.7	31:0	**Red Slot7** Format: MDCD_TileW Specifies the Slot 7 red channel data

Transpose Message Header

MH_T - Transpose Message Header

Source: DataPort 1

Size (in bits): 256

Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

DWord	Bit	Description
0	31:0	**X Offset** Format: S31 X offset (in bytes) of the upper left corner of the block into the surface. **Programming Notes** This field must be a multiple of the Block Width in bytes. Must be DWORD aligned.
1	31:0	**Y Offset** Format: S31 Y offset (in rows) of the upper left corner of the block into the surface. **Programming Notes** This field must be a multiple of the Block Height.
2	31:0	**Block Dimensions** Format: MHC_BDIM The height and width of the block to transpose.
3..7	159:0	**Reserved** Format: Ignore Ignored

Untyped Write Channel Mask Message Descriptor Control Field

MDC_UW_CMASK - Untyped Write Channel Mask Message Descriptor Control Field

Source: BSpec
Size (in bits): 4
Default Value: 0x00000000

DWord	Bit	Description
0	3:0	**Mask** Format: Enumeration For untyped surface write messages, indicates which channels are included in the message payload and written to the surface.

Value	Name	Description
00h	RGBA **[Default]**	Red, Green, Blue, and Alpha are included
08h	RGB	Red, Green, and Blue are included
0Ch	RG	Red and Green are included
0Eh	R	Red is included
Others	Reserved	Ignored

Upper Oword Block Data Payload

MDP_OW1U - Upper Oword Block Data Payload		
Source:	BSpec	
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0.0-0.3	127:0	**Reserved** Format: Ignore Ignored
0.4-0.7	127:0	**Oword** Format: U128 Specifies the upper Oword data element

VC1

VC1		
Source:	VideoCS	
Size (in bits):	16	
Default Value:	0x00000000	
DWord	**Bit**	**Description**
0	15:8	**Reserved** Format: MBZ
	7	**Syncmarker Error** This flag indicates missing sync marker SEs coded in the bit-stream.
	6	**Mbmode SE Error** This flag indicates inconsistent Macroblock SEs coded in the bit-stream.
	5	**Transformtype SE Error** This flag indicates inconsistent transform type SEs coded in the bit-stream.
	4	**Coefficient Error** This flag indicates inconsistent Coefficient SEs coded in the bit-stream.
	3	**Motion Vector SE Error** This flag indicates inconsistent Motion Vector SEs coded in the bit-stream.
	2	**Coded Block Pattern CY SE Error** This flag indicates inconsistent CBPCY SEs coded in the bit-stream.
	1	**Mquant Error** This flag indicates inconsistent MQUANT SEs coded in the bit-stream.
	0	**MB Concealment Flag** . Each pulse from this flag indicates one MB is concealed by hardware.

VCS Hardware-Detected Error Bit Definitions

VCS Hardware-Detected Error Bit Definitions

Source: VideoCS
Size (in bits): 16
Default Value: 0x00000000

DWord	Bit	Description
0	15:3	**Reserved** Format: MBZ
	2	**Command Privilege Violation Error** This bit is set if a command classified as privileged is parsed in a non-privileged batch buffer. The command will be converted to a NOOP and parsing will continue.
	1	**Reserved** Format: MBZ
	0	**Instruction Error** This bit is set when the Renderer Instruction Parser detects an error while parsing an instruction. Instruction errors include: • Client ID value (Bits 31:29 of the Header) is not supported (only MI, 2D and 3D are supported). • Defeatured MI Instruction Opcodes: **Value** / **Name** / **Description** 1 / / Instruction Error detected **Programming Notes** This error indications cannot be cleared except by reset (i.e., it is a fatal error).

VEB_DI_IECP_COMMAND_SURFACE_CONTROL_BITS

VEB_DI_IECP_COMMAND_SURFACE_CONTROL_BITS

Source: VideoEnhancementCS
Size (in bits): 11
Default Value: 0x00000000

DWord	Bit	Description
0	10:9	**Tiled Resource Mode for Output Frame Surface Base Address** **For Media Surfaces:** This field specifies the tiled resource mode. Value / Name / Description: 0h / TRMODE_NONE / No tiled resource 1h / TRMODE_TILEYF / 4KB tiled resources 2h / TRMODE_TILEYS / 64KB tiled resources 3h / Reserved /
	8	**Memory Compression Mode** Description: Distinguishes Vertical from Horizontal compression. Value / Name: 0 / Horizontal Compression Mode 1 / Vertical Compression Mode
	7	**Memory Compression Enable** Format: Enable Memory compression will be attempted for this surface.
	6:1	**Index to Memory Object Control State (MOCS) Tables** The index to define the L3 and system cache memory properties. The details of the controls are further defined in L3 and Page walker (memory interface) control registers. The field is defined to populate 64 different surface controls to be used concurrently. Related control registers can be updated during runtime.
	0	**Reserved**

VEBOX_ACE_LACE_STATE

VEBOX_ACE_LACE_STATE

Source: VideoEnhancementCS

Size (in bits): 416

Default Value: 0x00000068, 0x4C382410, 0x9C887460, 0xEBD8C4B0, 0x604C3824, 0xB09C8874, 0x0000D8C4, 0x04000400, 0x04000400, 0x04000400, 0x04000400, 0x04000400, 0x00000400

This state structure contains the IECP State Table Contents for ACE state.

DWord	Bit	Description
0	31:16	**Min_ACE_luma** Format: U16
	15:14	**LACE Single Histogram Set** This bit tells LACE which frames will be included in the histogram when the Deinterlacer is enabled.

Value	Name	Description
00b	Current	The histogram includes only the current frame.
01b	Previous	The histogram includes only the previous frame.
10b	Current + Previous	The histogram includes pixels from both the current and previous frame.
11b	Previous + Current	The histogram includes the previous frame followed by the current frame.

Programming Notes
When the Deinterlacer is disabled, this field must be 00b. If **DI Output Frames** is set to only output a single field then the histogram can not be collected on the disabled field. This Field must be set to 00b when DN/DI First Frame is set to 1

	13	**LACE Histogram Size**

Value	Name
0	128-bin histogram
1	256-bin histogram

	12	**LACE Histogram Enable** Default Value: 0 This bit enables the collection of LACE histogram data. If this bit is 0 then only the ACE histogram will be collected.
	11:7	**Reserved** Format: MBZ

VEBOX_ACE_LACE_STATE

	6:2	**Skin Threshold** Format: U5 Used for Y analysis (min/max) for pixels which are higher than skin threshold. Value / Name [1,31] 26 **[Default]**
	1	**Reserved** Format: MBZ
	0	**ACE Enable** Format: Enable
1	31:24	**Y3** Default Value: 76 Format: U8 The value of the y_pixel for point 3 in PWL.
	23:16	**Y2** Default Value: 56 Format: U8 The value of the y_pixel for point 2 in PWL.
	15:8	**Y1** Default Value: 36 Format: U8 The value of the y_pixel for point 1 in PWL.
	7:0	**Ymin** Default Value: 16 Format: U8 The value of the y_pixel for point 0 in PWL.
2	31:24	**Y7** Default Value: 156 Format: U8 The value of the y_pixel for point 7 in PWL.

VEBOX_ACE_LACE_STATE

	23:16	**Y6** Default Value: 136 Format: U8 The value of the y_pixel for point 6 in PWL.
	15:8	**Y5** Default Value: 116 Format: U8 The value of the y_pixel for point 5 in PWL.
	7:0	**Y4** Default Value: 96 Format: U8 The value of the y_pixel for point 4 in PWL.
3	31:24	**Ymax** Default Value: 235 Format: U8 The value of the y_pixel for point 11 in PWL.
	23:16	**Y10** Default Value: 216 Format: U8 The value of the y_pixel for point 10 in PWL.
	15:8	**Y9** Default Value: 196 Format: U8 The value of the y_pixel for point 9 in PWL.
	7:0	**Y8** Default Value: 176 Format: U8 The value of the y_pixel for point 8 in PWL.
4	31:24	**B4** Default Value: 96 Format: U8 The value of the bias for point 4 in PWL.

VEBOX_ACE_LACE_STATE

	23:16	**B3** Default Value: 76 Format: U8 The value of the bias for point 3 in PWL.
	15:8	**B2** Default Value: 56 Format: U8 The value of the bias for point 2 in PWL.
	7:0	**B1** Default Value: 36 Format: U8 The value of the bias for point 1 in PWL.
5	31:24	**B8** Default Value: 176 Format: U8 The value of the bias for point 8 in PWL.
	23:16	**B7** Default Value: 156 Format: U8 The value of the bias for point 7 in PWL.
	15:8	**B6** Default Value: 136 Format: U8 The value of the bias for point 6 in PWL.
	7:0	**B5** Default Value: 116 Format: U8 The value of the bias for point 5 in PWL.
6	31:16	**Reserved** Format: MBZ

VEBOX_ACE_LACE_STATE

	15:8	**B10** Default Value: 216 Format: U8 The value of the bias for point 10 in PWL.
	7:0	**B9** Default Value: 196 Format: U8 The value of the bias for point 9 in PWL.
7	31:27	**Reserved** Format: MBZ
	26:16	**S1** Default Value: 1024 Format: U1.10 The value of the slope for point 1 in PWL The default is 1024/1024
	15:11	**Reserved** Format: MBZ
	10:0	**S0** Default Value: 1024 Format: U1.10 The value of the slope for point 0 in PWL The default is 1024/1024
8	31:27	**Reserved** Format: MBZ
	26:16	**S3** Default Value: 1024 Format: U1.10 The value of the slope for point 3 in PWL The default is 1024/1024
	15:11	**Reserved** Format: MBZ

VEBOX_ACE_LACE_STATE

	10:0	**S2** Default Value: 1024 Format: U1.10 The value of the slope for point 2 in PWL The default is 1024/1024
9	31:27	**Reserved** Format: MBZ
	26:16	**S5** Default Value: 1024 Format: U1.10 The value of the slope for point 5 in PWL The default is 1024/1024
	15:11	**Reserved** Format: MBZ
	10:0	**S4** Default Value: 1024 Format: U1.10 The value of the slope for point 4 in PWL The default is 1024/1024
10	31:27	**Reserved** Format: MBZ
	26:16	**S7** Default Value: 1024 Format: U1.10 The value of the slope for point 7 in PWL The default is 1024/1024
	15:11	**Reserved** Format: MBZ

VEBOX_ACE_LACE_STATE

	10:0	**S6** Default Value: 1024 Format: U1.10 The default is 1024/1024
11	31:27	**Reserved** Format: MBZ
	26:16	**S9** Default Value: 1024 Format: U1.10 The value of the slope for point 9 in PWL The default is 1024/1024
	15:11	**Reserved** Format: MBZ
	10:0	**S8** Default Value: 1024 Format: U1.10 The value of the slope for point 8 in PWL The default is 1024/1024
12	31:16	**Max_ACE_luma** Format: U16 The maximum luma for which ACE correction will be used.
	15:11	**Reserved** Format: MBZ
	10:0	**S10** Default Value: 1024 Format: U1.10 The value of the slope for point 10 in PWL.

VEBOX_ALPHA_AOI_STATE

VEBOX_ALPHA_AOI_STATE

Source: VideoEnhancementCS
Size (in bits): 96
Default Value: 0x00000000, 0x00030000, 0x00030000

This state structure contains the IECP State Table Contents for Fixed Alpha State and Area of Interest State.

DWord	Bit	Description
0	31:18	**Reserved** Format: MBZ
	17	**Full Image Histogram** Default Value: 0 Format: Enable Used to ignore the area of interest for a histogram across the full image. This applies to all statistics that are affected by AOI (Area of Interest).
	16	**Alpha from State Select** Format: U1 Enumerated type Value / Name: 0 – alpha is taken from message 1 – alpha is taken from state **Programming Notes** If the input format does not have alpha available and the output format provides alpha, this bit should be set to 1. This should be 0 when Alpha Plane Enable is 1.
	15:0	**Color Pipe Alpha** Format: U16 **Programming Notes** The 8 MSB of this field will be used for output formats that have 8-bits of alpha.
1	31:30	**Reserved** Format: MBZ
	29:16	**AOI Max X** Default Value: 3 Format: U14

VEBOX_ALPHA_AOI_STATE

		Area of Interest Minimum X - The ACE histogram and Skin Tone Detection statistic gathering will occur within the MinX/MinY to MaxX/MaxY area (inclusive). AOI must intersect the frame such that at least 1 pixel is in the AOI. The Area of Interest applies to the RGB Histogram and the White/Gray point sums as well. **Programming Notes** **This value must be a multiple of 4 minus 1.**
	15:14	**Reserved** Format: MBZ
	13:0	**AOI Min X** Default Value: 0 Format: U14 **Programming Notes** **This value must be a multiple of 4.**
2	31:30	**Reserved** Format: MBZ
	29:16	**AOI Max Y** Default Value: 3 Format: U14 **Programming Notes** **This value must be a multiple of 4 minus 1.**
	15:14	**Reserved** Format: MBZ
	13:0	**AOI Min Y** Default Value: 0 Format: U14 **Programming Notes** **This value must be a multiple of 4.**

VEBOX_CAPTURE_PIPE_STATE

VEBOX_CAPTURE_PIPE_STATE

Source: VideoEnhancementCS

Size (in bits): 224

Default Value: 0x0511FF23, 0xAA64AFAA, 0xE6FD4000, 0x00000000, 0x00000000, 0x00000000, 0x00000000

This command contains variables for controlling Demosaic and the White Balance Statistics.

DWord	Bit	Description
0	31:30	**Reserved** Format: MBZ
	29:24	**Good Pixel Threshold** Format: U6 The difference threshold between adjacent pixels for a pixel to be considered "good". Value: 5h — Name: **[Default]**
	23	**Reserved** Format: MBZ
	22:20	**Shift Min Cost** Default Value: 1h Format: U3 The amount to shift the H2/V2 versions of min_cost.
	19:16	**Green Imbalance Threshold** Default Value: 1h Format: U4
	15:8	**Average Color Threshold** Format: U8 The threshold between two colors in a pixel for the Avg interpolation to be considered. Value: FFh — Name: **[Default]** **Programming Notes** Must be set to 255.
	7:6	**Reserved** Format: U2

VEBOX_CAPTURE_PIPE_STATE

	5:0	**Good Pixel Neighbor Threshold** Default Value: 23h Format: U6 Number of comparisons with neighbor pixels which pass before a pixel is considered good.
1	31:28	**Scale For Min Cost** Default Value: Ah The amount to scale the min_cost difference during the confidence check.
	27:24	**Good Intesity Threshold** Default Value: Ah Format: U4
	23:16	**Bad Color Threshold 1** Default Value: 64h Format: U8 Color value threshold used during the bad pixel check.
	15:8	**Bad Color Threshold 2** Default Value: AFh Format: U8 Color value threshold used during the bad pixel check.
	7:4	**Number Big Pixel Threshold** Default Value: Ah Format: U4 Number of comparisons with neighbor pixels which pass before a pixel is considered good.
	3:0	**Bad Color Threshold 3** Default Value: Ah Format: U4 Color value threshold used during the bad pixel check.
2	31:24	**Y Bright Value** Default Value: E6h The whitepoint threshold percentile in the Y histogram. Any pixel with Y value above this could be a whitepoint. This is the larger of the calculated Ybright value and the Ythreshold value, which is the minimum Y required to be considered a white point. **Programming Notes**

VEBOX_CAPTURE_PIPE_STATE

		"00000000" is appended to the LSBs before comparing with Y.
	23:16	**Y Outlier Value** Default Value: FDh The outlier threshold percentile in the Y histogram. Any pixel with Y value above this either clipped or an outlier in the image. These points will not be included in the white patch calculation. **Programming Notes** "00000000" is appended to the LSBs before comparing with Y.
	15:8	**UV Threshold Value** The value denotes the maximum threshold of the ratio between U+V to Y can have to be considered a gray point. Value: [255,0] — Name: — Description: Encode a value from 255/256 to 0/256 Value: 64 — Name: **[Default]** — Description: 0.25 * 255 = 64
	7	**Black Point Offset Red MSB**
	6	**Black Point Offset Green Top MSB**
	5	**Black Point Offset Blue MSB**
	4	**Black Point Offset Green Bottom MSB**
	3	**RGB Histogram Enable** Enables the collection of RGB Histograms for Auto-white balance correction and other uses. **Programming Notes** This bit can be set without White Balance enable being set.
	2	**Vignette Correction Format** Defines what shift should be assumed for the **Vignette** Correction input values: Value: 0 — Name: U8.8 Value: 1 — Name: U4.12
	1	**Black Point Correction Enable** Format: Enable
	0	**White Balance Correction Enable** Format: Enable **Programming Notes** RGB Histogram enable must be set if this bit is set.
3	31:16	**Black Point Offset Red** Default Value: 0 Format: U16

VEBOX_CAPTURE_PIPE_STATE

		Value subtracted from Red pixels of Bayer pattern - combined with MSB to form a 2's complement signed number.
	15:0	**Black Point Offset Green Top** Default Value: 0 Format: U16 Value subtracted from the top Green pixels of Bayer pattern (X=1, Y=0 for Bayer Pattern #1) - combined with MSB to form a 2's complement signed number.
4	31:16	**Black Point Offset Blue** Default Value: 0 Format: U16 Value subtracted from Blue pixels of Bayer pattern - Combine with MSB to form a 2's complement signed number.
	15:0	**Black Point Offset Green Bottom** Default Value: 0 Format: U16 Value subtracted from the bottom Green pixels of Bayer pattern (X=0, Y=1 for Bayer Pattern #1) - combined with MSB to form a 2's complement signed number.
5	31:16	**White Balance Red Correction** Format: U4.12 The correction factor multiplied by the Red pixels of the Bayer pattern.
	15:0	**White Balance Green Top Correction** Format: U4.12 The correction factor multiplied by the top Green pixels of the Bayer pattern(X=1, Y=0 for Bayer Pattern #1).
6	31:16	**White Balance Blue Correction** Format: U4.12 The correction factor multiplied by the Blue pixels of the Bayer pattern.
	15:0	**White Balance Green Bottom Correction** Format: U4.12 The correction factor multiplied by the bottom Green pixels of the Bayer pattern (X=0, Y=1 for Bayer Pattern #1)

VEBOX_CCM_STATE

VEBOX_CCM_STATE		
Source:	VideoEnhancementCS	
Size (in bits):	288	
Default Value:	0x00000475, 0x00000AE8, 0x00000047, 0x00000022, 0x0001FFCC, 0x00000D23, 0x000000A8, 0x0001FFF4, 0x00000D6A	
This state structure contains the IECP State Table Contents for the Color Correction Matrix State.		
DWord	**Bit**	**Description**
0	31	**Color Correction Matrix Enable** Format: Enable This bit enables the Color Correction Matrix. **Programming Notes** Single Pipe IECP Enable must also be set if this bit is enabled.
	30:17	**Reserved** Format: MBZ
	16:0	**C1** Default Value: 000475h = 1141/4096 Format: S4.12 Coefficient of 3x3 Transform matrix
1	31:17	**Reserved** Format: MBZ
	16:0	**C0** Default Value: 000AE8h = 2792/4096 Format: S4.12 Coefficient of 3x3 Transform matrix
2	31:17	**Reserved** Format: MBZ
	16:0	**C3** Default Value: 000047h = 71/4096 Format: S4.12 Coefficient of 3x3 Transform matrix
3	31:17	**Reserved** Format: MBZ

VEBOX_CCM_STATE

	16:0	**C2** Default Value: 000022h = 34/4096 Format: S4.12 Coefficient of 3x3 Transform matrix
4	31:17	**Reserved** Format: MBZ
	16:0	**C5** Default Value: 1FFFCCh = -52/4096 Format: S4.12 Coefficient of 3x3 Transform matrix

This state table is used by the *Denoise and Deinterlacer functions*.

- DW0 to 2 are for Temporal Denoise
- DW3 is for global noise estimate and hot pixel detection
- DW4 is for Chroma Denoise
- DW5 to 11 are for 5x5 spatial denoise
- DW12 to 17 are for Deinterlacer
- DW18 to 24 Reserved

DWord	Bit	Description
0	31:20	**Denoise STAD Threshold** Format: U12 Threshold for denoise sum of temporal absolute differences.
	19:12	**Denoise Maximum History** Format: U8 Maximum allowed value for denoise history. Value: [128,240] — Name:
	11:8	**Denoise History increase** Format: U4 Amount that denoise_history is increased by. MAX:15 Value: 8h — Name: **[Default]** Value: 15 — Description: Maximum Allowed
	7:5	**Reserved** Format: MBZ
	4:0	**Denoise Moving Pixel Threshold** Format: U5 Value — Name

VEBOX_DNDI_STATE

		[0,16]
1	31:20	**Denoise ASD Threshold** Format: U12 Threshold for denoise absolute sum of differences. Value: [0,1023]; Name:
	19:10	**Temporal Difference Threshold** Format: U10 **Programming Notes** 0 <(**Temporal Difference Threshold** - **Low Temporal Difference Threshold**) < = 256 except when both thresholds are set to 0.
	9:0	**Low Temporal Difference Threshold** Format: U10 **Programming Notes** 0 <(**Temporal Difference Threshold** - **Low Temporal Difference Threshold**) < = 256 except when both thresholds are set to 0.
2	31:29	**Reserved** Format: MBZ
	28	**Progressive DN** Format: Enable Indicates that the denoise algorithm should assume progressive input when filtering neighboring pixels. **This bit must be set if the input to Denoise is RGB.** Value 0: DN assumes interlaced video and filters alternate lines together Value 1: DN assumes progressive video and filters neighboring lines together **Programming Notes** **DI Enable** must be disabled when this field is enabled.
	27:16	**Denoise Threshold for Sum of Complexity Measure** Format: U12
	15:10	**Initial Denoise History** Default Value: 32 Format: U6 Initial value for Denoise history for both Luma and Chroma

VEBOX_DNDI_STATE

9:0 Reserved

Format:	MBZ

3 — 31:28 Hot Pixel Count

Format:	U4

Number of neighboring pixels different more than **Hot Pixel Threshold** before a pixel is considered hot.

Value	Name
[0,8]	

Programming Notes
0 will cause all pixels to be considered hot and will perform a median filter on the entire image.

27:20 Hot Pixel Threshold

Format:	U8

Threshold for a difference from the value of a neighboring pixel. Is shifted up to 16-bits before compare.

19:12 Block Noise Estimate Edge Threshold

Format:	U8

Threshold for detecting an edge in block noise estimate.

Value	Name	Description
16	**[Default]**	
255		Maximium Value

11:0 Block Noise Estimate Noise Threshold

Format:	U12

Threshold for noise maximum/minimum.

Value	Name
[0, 511]	

4 — 31:24 Reserved

Format:	MBZ

23:16 Chroma Denoise STAD Threshold

Format:	U8

Threshold for denoise sum of temporal absolute differences.

15:13 Reserved

Format:	MBZ

12 Chroma Denoise Enable

Value	Name	Description

VEBOX_DNDI_STATE

This state structure contains the state used by the STD/STE function.

DWord	Bit	Description
0	31:24	**V_Mid** Default Value: 154 Format: U8 Rectangle middle-point V coordinate.
	23:16	**U_Mid** Default Value: 110 Format: U8 Rectangle middle-point U coordinate.
	15:10	**Hue_Max** Default Value: 14 Format: U6 Rectangle half width.
	9:4	**Sat_Max** Default Value: 31 Format: U6 Rectangle half length.
	3	**Reserved** Format: MBZ
	2	**Output Control** Value 0: Output Pixels Value 1: Output STD Decisions

VEBOX_STD_STE_STATE

	1	**STE Enable** Format: Enable
	0	**STD Enable** Format: Enable **Programming Notes** This needs to be enabled if 'STD Score Output' is enabled.
1	31	**STD Score Output** Format: Enable
	30:28	**Diamond Margin** Default Value: 4 Format: U3
	27:21	**Diamond_du** Default Value: 0 Format: S6 2's complement Rhombus center shift in the sat-direction, relative to the rectangle center.
	20:18	**HS_margin** Default Value: 3 Format: U3 Defines rectangle margin.
	17:10	**Cos(α)** Default Value: 79 Format: S0.7 2's complement The default is 79/128
	9:8	**Reserved** Format: MBZ
	7:0	**Sin(α)** Default Value: 101 Format: S0.7 2's complement The default is 101/128
2	31:21	**Reserved** Format: MBZ

VEBOX_STD_STE_STATE

	20:13	**Diamond_alpha** Default Value: 100 Format: U2.6 1/tan(β) The default is 100/64
	12:7	**Diamond_Th** Default Value: 35 Format: U6 Half length of the rhombus axis in the sat-direction.
	6:0	**Diamond_dv** Default Value: 0 Format: S6 2's complement Rhombus center shift in the hue-direction, relative to the rectangle center.
3	31:24	**Y_point_3** Default Value: 254 Format: U8 Third point of the Y piecewise linear membership function.
	23:16	**Y_point_2** Default Value: 47 Format: U8 Second point of the Y piecewise linear membership function.
	15:8	**Y_point_1** Default Value: 46 Format: U8 First point of the Y piecewise linear membership function.
	7	**VY_STD_Enable** Format: Enable Enables STD in the VY subspace.
	6:0	**Reserved** Format: MBZ
4	31:18	**Reserved** Format: MBZ

VEBOX_STD_STE_STATE

	17:13	**Y_Slope_2** Default Value: 31 Format: U2.3 Slope between points Y3 and Y4. The default is 31/8
	12:8	**Y_Slope_1** Default Value: 31 Format: U2.3 Slope between points Y1 and Y2. The default is 31/8
	7:0	**Y_point_4** Default Value: 255 Format: U8 Fourth point of the Y piecewise linear membership function.
5	31:16	**INV_Skin_types_margin** Default Value: 20 Skin_Type_margin Format: U0.16 1/(2* Skin_types_margin)
	15:0	**INV_Margin_VYL** Format: U0.16 1 / Margin_VYL 1/ Margin_VYL = 3300/65536
6	31:24	**P1L** Default Value: 216 Format: U8 Y Point 1 of the lower part of the detection PWLF.
	23:16	**P0L** Default Value: 46 Format: U8 Y Point 0 of the lower part of the detection PWLF.

VEBOX_STD_STE_STATE

	15:0	**INV_Margin_VYU** Default Value: 1600 Format: U0.16 1 / Margin_VYU = 1600/65536
7	31:24	**B1L** Default Value: 130 Format: U8 V Bias 1 of the lower part of the detection PWLF.
	23:16	**B0L** Default Value: 133 Format: U8 V Bias 0 of the lower part of the detection PWLF.

VEBOX_TCC_STATE

	19:10	**BaseColor5** Default Value: 819 Format: U10 Base Color 5 - this value must be greater than BaseColor4
	9:0	**BaseColo4** Default Value: 657 Format: U10 Base Color 4 - this value must be greater than BaseColor3
4	31:16	**ColorTransitSlope23** Default Value: 744 Format: U0.16 The calculation result of 1 / (BC3 - BC2) [1/62]
	15:0	**ColorTransitSlope2** Default Value: 405 Format: U0.16 The calculation result of 1 / (BC2 - BC1) [1/57]
5	31:16	**ColorTransitSlope45** Default Value: 407 Format: U0.16 The calculation result of 1 / (BC5 - BC4) [1/57]
	15:0	**ColorTransitSlope34** Default Value: 1131 Format: U0.16 The calculation result of 1 / (BC4 - BC3) [1/61]
6	31:16	**ColorTransitSlope61** Default Value: 377 Format: U0.16 The calculation result of 1 / (BC1 - BC6) [1/62]
	15:0	**ColorTransitSlope56** Default Value: 372 Format: U0.16 The calculation result of 1 / (BC6 - BC5) [1/62]

VEBOX_TCC_STATE

7	31:22	**ColorBias3** Default Value: 0 Format: U2.8 Color bias for BaseColor3.
	21:12	**ColorBias2** Default Value: 150 Format: U2.8 Color bias for BaseColor2. The default is 150/256
	11:2	**ColorBias1** Default Value: 0 Format: U2.8 Color bias for BaseColor1.
	1:0	**Reserved** Format: MBZ
8	31:22	**ColorBias6** Default Value: 0 Format: U2.8 Color bias for BaseColor6.
	21:12	**ColorBias5** Default Value: 0 Format: U2.8 Color bias for BaseColor5.
	11:2	**ColorBias4** Default Value: 0 Format: U2.8 Color bias for BaseColor4.
	1:0	**Reserved** Format: MBZ
9	31	**Reserved** Format: MBZ

VEBOX_TCC_STATE

	30:24	**UV Threshold** Default Value: 3 Format: U7 Low UV threshold.
	23:19	**Reserved** Format: MBZ
	18:16	**UV Threshold Bits** Default Value: 3 Format: U3 Low UV transition width bits.
	15:13	**Reserved** Format: MBZ
	12:8	**STE Threshold** Default Value: 0 Format: U5 Skin tone pixels enhancement threshold.
	7:3	**Reserved** Format: MBZ
	2:0	**STE Slope Bits** Default Value: 0 Format: U3 Skin tone pixels enhancement slope bits.
10	31:16	**Inv_UVMaxColor** Default Value: 146 Format: U16 1 / UVMaxColor. Used for the SFs2 calculation.
	15:9	**Reserved** Format: MBZ
	8:0	**UVMaxColor** Default Value: 448 Format: U9 The maximum absolute value of the legal UV pixels. Used for the SFs2 calculation.

VEBOX_VERTEX_TABLE

0x00000000, 0x00000000

DWord	Bit	Description
0..511	31:28	**Reserved** Format: MBZ
	27:16	**Vertex table entry 0 - Lv (12 bits)** Value: 100h-ED6h; Name: ; Description: Range for Vertices BT601 and BT709
	15:12	**Reserved** Format: MBZ
	11:0	**Vertex table entry 0 - Cv (12 bits)** Value: 400h-A00h; Name: ; Description: Range for Vertices BT601 and BT709

VECS Hardware-Detected Error Bit Definitions

VECS Hardware-Detected Error Bit Definitions

Source: VideoEnhancementCS
Size (in bits): 16
Default Value: 0x00000000

DWord	Bit	Description
0	15:3	**Reserved** Format: MBZ
	2	**Command Privilege Violation Error** This bit is set if a command classified as privileged is parsed in a non-privileged batch buffer. The command will be converted to a NOOP and parsing will continue.
	1	**Reserved** Format: MBZ
	0	**Instruction Error** This bit is set when the Renderer Instruction Parser detects an error while parsing an instruction. Instruction errors include: • Client ID value (Bits 31:29 of the Header) is not supported (only MI, 2D and 3D are supported). • Defeatured MI Instruction Opcodes: **Value** / **Name** / **Description**: 1 / / Instruction Error detected **Programming Notes**: This error indications cannot be cleared except by reset (i.e., it is a fatal error).

VERTEX_BUFFER_STATE

VERTEX_BUFFER_STATE

Source: RenderCS
Size (in bits): 128
Default Value: 0x00000000, 0x00000000, 0x00000000, 0x00000000

This structure is used in 3DSTATE_VERTEX_BUFFERS to set the state associated with a VB. The VF function will use this state to determine how/where to extract vertex element data for all vertex elements associated with the VB.

DWord	Bit	Description
0	31:26	**Vertex Buffer Index** Format: U6 index This field contains an index value which selects the VB state being defined. Value: [0,32] — Name:
	25:23	**Reserved** Format: MBZ
	22:16	**Memory Object Control State** Format: MEMORY_OBJECT_CONTROL_STATE Specifies the memory object control state for this vertex buffer.
	15	**Reserved** Format: MBZ
	14	**Address Modify Enable** If set, the Buffer Starting Address field is used to update the state of this buffer. If clear, that field is ignored and the previously-programmed value is maintained.
	13	**Null Vertex Buffer** Format: Enable This field enabled causes any fetch for vertex data to return 0. Programming Notes: VERTEX_BUFFER_STATE.Null Vertex Buffer must be set when the VERTEX_BUFFER_STATE.Buffer Size is 0x0.
	12	**Reserved** Format: MBZ
	11:0	**Buffer Pitch** Format: U12 Count of bytes This field specifies the pitch in bytes of the structures accessed within the VB. This information is required in order to access elements in the VB via a structure index.

VERTEX_BUFFER_STATE

Value	Name	Description
[0,4095]		Bytes

Programming Notes

- Different VERTEX_BUFFER_STATE structures can refer to the same memory region using different Buffer Pitch values.
- See note on 64-bit float alignment in Buffer Starting Address.

1..2 | 63:0 | **Buffer Starting Address**

Format:	GraphicsAddress[63:0]Vertex_Buffer

This field contains the byte-aligned Graphics Address LSBs of the first element of interest within the VB. Software must program this value with the combination (sum) of the base address of the memory resource and the byte offset from the base address to the starting structure within the buffer.

If the Address ModifyEnable bit is clear, this field is ignored and the previous value of Buffer Starting Address for this buffer is maintained.

Programming Notes

- 64-bit floating point values must be 64-bit aligned in memory, or UNPREDICTABLE data will be fetched. When accessing an element containing 64-bit floating point values, the Buffer Starting Address and Source Element Offset values must add to a 64-bit aligned address, and BufferPitch must be a multiple of 64-bits.
- VBs can only be allocated in linear (not tiled) graphics memory.
- As computed index values are, by definition, interpreted as unsigned values, there is no issue with accesses to locations before (lower address value) the start of the buffer. However, these wrapped indices are subject to Max Index checking (see below).

3 | 31:0 | **Buffer Size**

Format:	U32 Count of bytes

This field specifies the size of the buffer in bytes. Vertex element accesses which straddle or go past the end of the buffer will return 0's for all elements.Note that BufferSize=0 indicates that there is no valid data in the buffer.

Value	Name
[0, FFFFFFFFh]	

VERTEX_ELEMENT_STATE

VERTEX_ELEMENT_STATE

Source:	RenderCS
Size (in bits):	64
Default Value:	0x00000000, 0x00000000

Description

This structure is used in 3DSTATE_VERTEX_ELEMENTS to set the state associated with a vertex element. A vertex element is defined as an entity supplying from one to four DWord vertex components, to be stored in the vertex URB entry.

The number of supported vertex elements is 34.

The VF function will use this state, and possibly the state of the associated vertex buffer, to fetch/generate the source vertex element data, perform any required format conversions, padding with zeros, and store the resulting destination vertex element data into the vertex URB entry.

Programming Notes

- The (new) 3DSTATE_VF_SGVS command is used to specify optional insertion of VertexID and/or InstanceID into the input vertex data, logically following the processing of the VERTEX_ELEMENT_STATE structures. The VFCOMP_STORE_VID/IID encodings are no longer available in VERTEX_ELEMENT_STATE.
- When SourceElementFormat is set to one of the *64*_PASSTHRU formats, 64-bit components are stored in the URB without any conversion. In this case, vertex elements must be written as 128 or 256 bits, with VFCOMP_STORE_0 being used to pad the output as required. E.g., if R64_PASSTHRU is used to copy a 64-bit Red component into the URB, Component 1 must be specified as VFCOMP_STORE_0 (with Components 2,3 set to VFCOMP_NOSTORE) in order to output a 128-bit vertex element, or Components 1-3 must be specified as VFCOMP_STORE_0 in order to output a 256-bit vertex element. Likewise, use of R64G64B64_PASSTHRU requires Component 3 to be specified as VFCOMP_STORE_0 in order to output a 256-bit vertex element.
- When SourceElementFormat is set to one of the *64*_PASSTHRU formats then VFCOMP_STORE_SRC must be used for every valid component.
- Any SourceElementFormat of *64*_PASSTHRU cannot be used with an element which has edge flag enabled.

The SourceElementFormat needs to be a single-component format with an element which has edge flag enabled.

DWord	Bit	Description
0	31:26	**Vertex Buffer Index** Format: U6 This field specifies which vertex buffer the element is sourced from. [0,32] — Up to 33 VBs are supported

VERTEX_ELEMENT_STATE

Programming Notes

It is possible for a vertex element to include only internally-generated data (VertexID, etc.), in which case the associated vertex buffer state is ignored.

25 **Valid**

Format:	Boolean

Value	Name	Description
1h	TRUE	this vertex element is used in vertex assembly
0h	FALSE	this vertex element is not used.

24:16 **Source Element Format**

Format:	SURFACE_FORMAT

Range: Valid formats are found in the 3D Primitive Processing FormatConversion portion of the vertex fetch chapter.

Format: The encoding of this field is identical the Surface Format field of the SURFACE_STATE structure, as described in the Sampler chapter.

This field specifies the format in which the memory-resident source data for this particular vertex element is stored in the memory buffer. This only applies to elements stored with VFCOMP_STORE_SRC component control. (All other component types have an explicit format).

15 **Edge Flag Enable**

Format:	Enable

Description

When ENABLED, the source element is interpreted as an EdgeFlag for the vertex. If the source element is zero, the EdgeFlag will be set to FALSE. If the source element is non-zero, the EdgeFlag will be set to TRUE. The EdgeFlag bit will travel down the fixed function pipeline along with the vertex handle, etc. and not be stored in the vertex data like the other vertex elements. Refer to the fixed function descriptions for how this EdgeFlag affects rendering.
Edge flags are supported for the following primitive topology types only, otherwise EdgeFlagEnable must not be ENABLED.

- 3DPRIM_TRILIST*
- 3DPRIM_TRISTRIP*
- 3DPRIM_TRIFAN*
- 3DPRIM_POLYGON

If this bit is DISABLED for all valid VERTEX_ELEMENTs, the vertex will be assigned a default EdgeFlag of TRUE.

Edge flags are supported for all primitive topology types.

Programming Notes

VERTEX_ELEMENT_STATE

- This bit must only be ENABLED on the last valid VERTEX_ELEMENT structure.
- When set, Component 0 Control must be set to VFCOMP_STORE_SRC, and Component 1-3 Control must be set to VFCOMP_NOSTORE.

	14:12	**Reserved** Format: MBZ
	11:0	**Source Element Offset** Format: U12 byte offset Byte offset of the source vertex element data in the structures comprising the vertex buffer. **Value**: [0,2047] **Name**: **Programming Notes**: See note on 64-bit float alignment in Buffer Starting Address.
1	31	**Reserved** Format: MBZ
	30:28	**Component 0 Control** Format: 3D_Vertex_Component_Control Refer to the 3D_Vertex_Component_Control table below
	27	**Reserved** Format: MBZ

Vertical Line Stride Override Message Descriptor Control Field

MDC_VLSO - Vertical Line Stride Override Message Descriptor Control Field

Source:	BSpec
Size (in bits):	3
Default Value:	0x00000000

DWord	Bit	Description
0	2	**Vertical Line Stride Override** Format: Enable If set, override the Vertical Line Stride and Vertical Line Stride Offset fields in the surface state with the fields below.
	1	**Vertical Line Stride** Format: U1 Specifies number of lines (0 or 1) to skip between logically adjacent lines - provides support of interleaved (field) surfaces as textures.
	0	**Vertical Line Stride Offset** Format: U1 Specifies the offset of the initial line from the beginning of the buffer. Ignored when Override VerticalLine Stride is 0.

VFE_STATE_EX

VFE_STATE_EX		
Source:	RenderCS	
Size (in bits):	256	
Default Value:	0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000, 0x00000000	
DWord	**Bit**	**Description**
0	31:8	**Reserved**
	7:0	**Reserved** Format: MBZ
1	31:0	**VFE Control** This field is used by VFE depending on the mode of operation. See the following tables for details. If VFE Mode = AVC-IT or AVC-MC, this field is valid as defined in Table 1 13. If VFE Mode = VC1-IT, this field is valid as defined in Table 1 14. Otherwise, this field is reserved.
2	31:0	**Interface Descriptor Remap Table** This field contains the interface descriptor remap table entries for the first 8 kernel indices. Each table entry has 4 bits, providing a remapping range of [0, 15]. The input of this table is the Interface Descriptor Offset within the MEDIA_OBJECT or MEDIA_OBJECT_EX command. As the table is limited to map the first 16 values, any Interface Descriptor Offset greater than 15 is not remapped. Bits 31:28: Remap for index = 7 Bits 27:24: Remap for index = 6 Bits 23:20: Remap for index = 5 Bits 19:16: Remap for index = 4 Bits 15:12: Remap for index = 3 Bits 11:8: Remap for index = 2 Bits 7:4: Remap for index = 1 Bits 3:0: Remap for index = 0
3	31:0	**Interface Descriptor Remap Table (cont)** This field contains the interface descriptor remap table entries for the next 8 kernel indices (index = 8...15). Each table entry has 4 bits, providing a remapping range of [0, 15]. Bits 31:28: Remap for index = 15 Bits 27:24: Remap for index = 14 Bits 23:20: Remap for index = 13 Bits 19:16: Remap for index = 12 Bits 15:12: Remap for index = 11 Bits 11:8: Remap for index = 10

VFE_STATE_EX

		Bits 7:4: Remap for index = 9 Bits 3:0: Remap for index = 8
4	31	**Scoreboard Enable** This field enables and disables the hardware scoreboard in the Media Pipeline. If this field is cleared, hardware ignores the following scoreboard state fields. This should be enabled at all times in the state and the scoreboard enable field in the MEDIA_OBJECT command should be use instead. If this field is disabled, the scratch space pointer calculation will be incorrect and any attempt to use the scoreboard later will result in a hardware hang. **Value** / **Name** 0 — Scoreboard disabled 1 — Scoreboard enabled
	30	**Scoreboard Type** This field selects the type of scoreboard in use. This field must be zero (stalling scoreboard) **Value** / **Name** 0 — Stalling Scoreboard 1 — Reserved (for Non-stalling scoreboard)
	29:8	**Reserved** Format: MBZ
	7:0	**Scoreboard Mask** Format: Boolean Each bit indicates the corresponding dependency scoreboard is enabled. The scoreboard is based on the relative (X, Y) distance from the current threads' (X, Y) position. **Value** / **Name** / **Description** [0,7] / Bit n / Score n is enabled
5	31:28	**Scoreboard 3 Delta Y** Format: S3 Relative vertical distance of the dependent instance assigned to scoreboard 3, in the form of 2's compliment.
	27:24	**Scoreboard 3 Delta X** Format: S3 Relative horizontal distance of the dependent instance assigned to scoreboard 3, in the form of 2's compliment.
