INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH INTEL® PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

A "Mission Critical Application" is any application in which failure of the Intel Product could result, directly or indirectly, in personal injury or death. SHOULD YOU PURCHASE OR USE INTEL'S PRODUCTS FOR ANY SUCH MISSION CRITICAL APPLICATION, YOU SHALL INDEMNIFY AND HOLD INTEL AND ITS SUBSIDIARIES, SUBCONTRACTORS AND AFFILIATES, AND THE DIRECTORS, OFFICERS, AND EMPLOYEES OF EACH, HARMLESS AGAINST ALL CLAIMS COSTS, DAMAGES, AND EXPENSES AND REASONABLE ATTORNEYS' FEES ARISING OUT OF, DIRECTLY OR INDIRECTLY, ANY CLAIM OF PRODUCT LIABILITY, PERSONAL INJURY, OR DEATH ARISING IN ANY WAY OUT OF SUCH MISSION CRITICAL APPLICATION, WHETHER OR NOT INTEL OR ITS SUBCONTRACTOR WAS NEGLIGENT IN THE DESIGN, MANUFACTURE, OR WARNING OF THE INTEL PRODUCT OR ANY OF ITS PARTS.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined". Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

The products described in this document may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Implementations of the I2C bus/protocol may require licenses from various entities, including Philips Electronics N.V. and North American Philips Corporation.

## Half Precision Float to Single Precision Float

<b>f16to32 - Half Precision Float to Single Precision Float</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
<p>The f16to32 instruction converts the half precision float in src0 to single precision float and storing in dst.</p> <p>Because this instruction does not have a 16-bit floating-point type, the source data type must be Word (W). The destination type must be F (Float).</p>			
Format:	[[pred]] f16to32[.cmod] (exec_size) dst src0		
<b>Restriction</b>			
Restriction : The FP Mode (Single Precision Floating Point Mode in cr0) must be IEEE mode.			
Restriction : No accumulator access, implicit or explicit.			
<b>Syntax</b>			
[[pred]] f16to32[.cmod] (exec_size) reg reg [[pred]] f16to32[.cmod] (exec_size) reg imm16			
<b>Pseudocode</b>			
<pre>Evaluate(WrEn); for ( n = 0; n &lt; exec_size; n++ ) { if ( WrEn.chan[n] ) { dst.chan[n] = convert half precision float to single precision float(src0.chan[n]); } }</pre>

## f16to32 - Half Precision Float to Single Precision Float

		Format:	<b>EU_INSTRUCTION_OPERAND_CONTROLS</b>
	31:0	<b>Header</b>	
		Format:	<b>EU_INSTRUCTION_HEADER</b>

## End If

<b>endif - End If</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
Description			Project
<p>The endif instruction terminates an if/else/endif block of code. It restores execution to the channels that were active prior to the if/else/endif block.</p> <p>The endif instruction is also used to hop out of nested conditionals by jumping to the end of the next outer conditional block when all channels are disabled.</p>			
<p>The following table describes the 16-bit JIP. In GEN binary, JIP is at location src1 and must be of type W (signed word integer). JIP must be an immediate operand, it is a signed 16-bit number. This value is added to IP pre-increment.</p>			HSW
Format:	endif JIP		
Restriction			Project
Restriction : Predication is not allowed.			
Restriction : The execution size must be the same for the if, else, and endif instructions of the same code block.			HSW
Syntax		Project	
endif (exec_size) imm16		HSW	
Pseudocode			
Evaluate(WrEn); if ( WrEn == 0 ) { // all channels false Jump(IP + JIP); }

		Format:	MBZ
90	<b>Flag Register Number</b>		
		Project:	HSW
		Added a second flag register	
89	<b>Flag Subregister Number</b>		
		Project:	HSW
		This field specifies the sub-register number for a flag register operand. There are two sub-registers in the flag register. Each sub-register contains 16 flag bits. The selected flag sub-register is the source for predication if predication is enabled for the instruction. It is the destination to store conditional flag bits if conditional modifier is enabled for the instruction. The same flag sub-register can be both the predication source and conditional destination, if both predication and conditional modifier are enabled.

## Single Precision Float to Half Precision Float

<b>f32to16 - Single Precision Float to Half Precision Float</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
<p>The f32to16 instruction converts the single precision float in src0 to half precision float and storing in the lower word of each channel in dst.</p> <p>Because this instruction does not have a 16-bit floating-point type, the destination data type must be Word (W).</p>			
Format:	[(pred)] f32to16[.cmod] (exec_size) dst src0		
<b>Restriction</b>			
Restriction : The destination must be DWord-aligned and specify a horizontal stride (HorzStride) of 2. The 16-bit result is stored in the lower word of each destination channel and the upper word is not modified.			
Restriction : The FP Mode (Single Precision Floating Point Mode in cr0) must be IEEE mode.			
Restriction : No accumulator access, implicit or explicit.			
<b>Syntax</b>			
[(pred)] f32to16[.cmod] (exec_size) reg reg [(pred)] f32to16[.cmod] (exec_size) reg imm32			
<b>Pseudocode</b>

## Else

<b>else - Else</b>							
Project:	HSW						
Source:	EuIsa						
Length Bias:	4						
<p>The else instruction is an optional statement within an if/else/endif block of code. It restricts execution within the else/endif portion to the opposite set of channels enabled under the if/else portion. Channels which were inactive before entering the if/endif block remain inactive throughout the entire block.</p> <p>All enabled channels upon arriving at the else instruction are redirected to the matching endif. If all channels are redirected (by else or before else), a relative jump is performed to the location specified by JIP. The jump target should be the the matching endif instruction for that conditional block.</p> <p>The following table describes the 16-bit JIP. In GEN binary, JIP is at location src1 and must be of type W (signed word integer). JIP must be an immediate operand, it is a signed 16-bit number and is intended to be forward referencing. This value is added to IP pre-increment.</p>							
Format: else (exec_size) JIP							
<b>Restriction</b>							
Restriction : Predication is not allowed.							
Restriction : The execution size must be the same for the if, else, and endif instructions of the same code block.							
<b>Syntax</b>							
else (exec_size) imm16							
<b>Pseudocode</b>							
<pre>Evaluate(WrEn); for ( n = 0; n &lt; 32; n++ ) { if ( WrEn.channel[n] ) { PcIP[n] = IP + JIP; } } if ( PcIP != (IP + 1) ) { // for all channels Jump(IP + JIP); }</pre>

## Jump Indexed

<b>jmpil - Jump Indexed</b>	
Project:	HSW
Source:	EuIsa
Length Bias:	4
Description	Project
<p>The jmpil instruction redirects program execution to an index offset relative to the post-incremented instruction pointer. The index is a signed integer value, with positive or zero integers for forward jumps, and negative integers for backward jumps.</p> <p>Note: Unlike other flow control instructions, the offset used by jmpil is relative to the incremented instruction pointer rather than the IP value for the instruction itself.</p> <p>In GEN binary, index is at location src1. The ip register must be put (for example, by the assembler) at the dst and src0 locations.</p> <p>Predication is allowed to provide conditional jump with a scalar condition. As the execution size is 1, the first channel of PMASK (flags post prediction control and negate) is used to determine whether the jump is taken or not. If the condition is false, the jump is not taken and execution continues with the next instruction.</p>	
	DevHSW+
Format: [(pred)] jmpil (1) index {NoMask}	
Programming Notes	Project
An index of 0 does nothing, continuing execution with the next instruction.	
An index of -16 (if the jmpil instruction is in native format) or -8 (if the jmpil instruction is in compact format) is an infinite loop on the jmpil instruction.	DevHSW+
Restriction	
Restriction : The execution size must be 1.	
Restriction : The {NoMask} instruction option must be specified.	
Restriction : The index data type must be D (Signed DWord Integer).	
Syntax	
[(pred)] jmpil (1) reg32 {NoMask} [(pred)] jmpil (1) imm32 {NoMask}	
Pseudocode

## Illegal

<b>illegal - Illegal</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
<p>The Illegal Opcode Exception Enable flag in cr0.1 is normally set so the normal processing of an illegal opcode is to transfer control to the System Routine.</p> <p>Instruction dispatch treats any unused 8-bit opcode (including bit 7 of the instruction, reserved for future opcode expansion) as if it is the illegal opcode.</p> <p>The illegal opcode is zero because that byte value is more likely than most to be read via a wayward instruction pointer.</p> <p>The illegal instruction is an instruction only in the same way that a NULL pointer in software is a pointer. Both are special values indicating invalid instances.</p>			
Format:	illegal		
<b>Restriction</b>			
Restriction : The illegal instruction takes no instruction options.			
<b>Syntax</b>			
illegal			
<b>Pseudocode</b>			
<pre>{ Set the Illegal Opcode Exception Status bit in cr0.1. if ( Illegal Opcode Exception Enable is set in cr0.1 ) { Transfer control to the System Routine (return address to AIP, IP = SIP). } }</pre>

## Fraction

<b>frc - Fraction</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
<p>The frc instruction computes, component-wise, the truncate-to-minus-infinity fractional values of src0 and stores the results in dst. The results, in the range of [0.0, 1.0], are the fractional portion of the source data. The result is in the range [0.0, 1.0] irrespective of the rounding mode.</p> <p>Floating-point fraction computation follows the rules in the following tables, based on the current floating-point mode.</p>			
Format:	[(pred)] frc[.cmod] (exec_size) dst src0		
<b>Note:</b>			
<p><b>Note:</b> When the Rounding Mode in cr0.0 is not Round Down, the result from frc must be followed by compare and select instructions to avoid a result of 1.0. Those latter instructions must use the :ud type. For example:</p> <pre>cmp.ne.f0.0 null r4:ud 0x3f800000:ud (f0.0)sel r5:f r4:ud 0x3f7fffff:ud</pre>			
<b>Syntax</b>			
[(pred)] frc[.cmod] (exec_size) reg reg [(pred)] frc[.cmod] (exec_size) reg imm32			
<b>Pseudocode</b>			
<pre>Evaluate(WrEn); for ( n = 0; n &lt; exec_size; n++ ) { if ( WrEn.chan[n] ) { dst.chan[n] = src0.chan[n] - floor(src0.chan[n]); } }</pre>

## If

<b>if - If</b>			
Project:	HSW		
Source:	EuIisa		
Length Bias:	4		
Description			Project
<p>An if instruction starts an if/endif or an if/else/endif block of code. It restricts execution within the conditional block to only those channels that were enabled via the predicate control.</p> <p>Each if instruction must have a matching endif instruction and may have up to one matching else instruction before the matching endif.</p> <p>If all channels are inactive (for the if/endif or if/else/endif block), a jump is performed to the instruction referenced by JIP. This jump must be to right after the matching else instruction when present, or otherwise to the matching endif instruction of the conditional block.</p> <p>If SPF is ON, the UIP must be used to update IP; JIP is not used in this case.</p>			
<p>The following table describes the two 16-bit instruction pointer offsets. Both the JIP and UIP are signed 16-bit numbers, added to IP pre-increment. In GEN binary, JIP and UIP are at location src1 and must be of type W (signed word integer).</p>			HSW
<p>Format: [[pred]] if (exec_size) JIP UIP</p>			HSW
Restriction			
Restriction : The execution size must be the same for the if, else, and endif instructions of the same code block.			
Syntax			Project
[[pred]] if (exec_size) imm16 imm16			HSW
Pseudocode			
<pre>Evaluate(WrEn); for ( n = 0; n &lt; 32; n++ ) { if ( WrEn.channel[n] == 0 ) { PcIP[n] = IP + JIP; } else { PcIP[n] = IP + 1; } } if ( PcIP != (IP + 1) ) { // for all channels Jump(IP + JIP); }</pre>

## Compare

<b>cmp - Compare</b>	
Project:	HSW
Source:	EuIsa
Length Bias:	4
<p>The cmp instruction performs component-wise comparison of src0 and src1 and stores the results in the selected flag register and in dst. It takes component-wise subtraction of src0 and src1, evaluating the conditional code (excluding NS signal) based on the conditional modifier, and storing the conditional bits in bit-packed form in the destination flag register and all bits of dst channels. If the dst is not null, for the enabled channels, then all bits of the destination channel will contain the flag value for the channel. When the instruction operates on packed word format, one general register may store up to 16 such comparison results. In DWord format, one general register may store up to 8 results.</p> <p>A conditional modifier must be specified; the conditional modifier field cannot be 0000b. The comparison does not use the NS (NaN source) signals, as described in the Creating Conditional Flags section. Accordingly the conditional modifier should not be .u (unordered).</p> <p>For each enabled channel 0b or 1b is assigned to the appropriate flag bit and 0/all zeros or all ones (e.g, byte 0xFF, word 0xFFFF, DWord 0xFFFFFFFF) is assigned to dst.</p> <p>When any source type is floating-point, the cmp instruction obeys the rules described in the tables in the Floating Point Modes section of the Data Types chapter.</p>	
Format: <code>[(pred)] cmp[.cmod] (exec_size) dst src0 src1</code>	
Restriction	Project
Restriction : Accumulator cannot be destination, implicit or explicit. The destination must be a general register or the null register.	HSW
Restriction : A SIMD16 instruction is not allowed for DWord data types. Use two SIMD8 instructions.	DevHSW:GT1:A, DevHSW:GT2:A, DevHSW:GT3:A
Restriction : If the destination is the null register, the {Switch} instruction option must be used.	HSW
Syntax	
<code>[(pred)] cmp[.cmod] (exec_size) reg reg reg [(pred)] cmp[.cmod] (exec_size) reg reg imm32</code>	
Pseudocode	
<pre>Evaluate(WrEn); for ( n = 0; n &lt; exec_size; n++ ) { bitMask[n] = 0; if ( WrEn.chan[n] ) { results[n] = src0.chan[n] - src1.chan[n]; bitMask[n] =</pre>

## Continue

<b>cont - Continue</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
Description			Project
<p>The cont instruction disables execution for the subset of channels for the remainder of the current loop iteration. Channels remain disabled until right before the while instruction or right before the condition check code block for the while instruction. If all enabled channels hit this instruction, jump to the instruction referenced by JIP where execution continues.</p> <p>UIP should always reference the loop's associated while instruction. JIP should point to the last instruction of the inner most conditional block if the cont instruction is inside a conditional block. In case of the break instruction directly under the loop, the JIP and the UIP are the same.</p> <p>If SPF is ON, the UIP must be used to update IP; JIP is not used in this case.</p>			
<p>The following table describes the two 16-bit instruction pointer offsets. Both the JIP and UIP are signed 16-bit numbers, added to IP pre-increment. In GEN binary, JIP and UIP are at location src1 and must be of type W (signed word integer).</p>			HSW
<p>Format: [[pred]] cont (exec_size) JIP UIP</p>			
Restriction			
<p>Restriction : The execution size must be the same for the while, break, and cont instructions of the same code block.</p>			
Syntax			Project
<p>[[pred]] cont (exec_size) imm16 imm16</p>			HSW
Pseudocode			
<pre>Evaluate(WrEn); for ( n = 0; n &lt; exec_size; n++ ) { if ( WrEn.channel[n] ) { if ( PMask[n] ) { // PMask is for all channels enabled for the cont instruction. PcIP[n] = IP + UIP; } else { PcIP[n] = IP + 1; } } } for ( n = exec_size; n &lt; 32; n++ ) { PcIP[n] = IP + 1; } if ( PcIP != (IP + 1) ) { // all channels true Jump(IP + JIP); }</pre>

## Call

<b>call - Call</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
<b>Description</b>			<b>Project</b>
<p>The call instruction jumps to a subroutine. It can be predicated or non-predicated. If non-predicated, all enabled channels jump to the subroutine. If predicated, only the channels enabled by PMask jump to the subroutine; the rest of the channels move to the next instruction after the call instruction. If none of the channels jump into the subroutine, the call instruction is treated as a nop.</p> <p>In case of a jump, the call instruction stores the return IP onto the first DWord of the destination register and stores the CallMask in the second DWord of the destination register.</p> <p>When SPF is on, the predication control must be scalar.</p>			
<p>The following table describes JIP, the jump offset, for DevHSW+. JIP can be an immediate or register value. When a jump occurs, this value is added to IP pre-increment. For DevHSW+, in GEN binary, JIP is at location src1 when immediate and at location src0 when in a register. The IP register must be put (for example, by the assembler) at dst location. When offsets are immediate, src0 must be null.</p>			HSW
<p>Format: [[pred]] call (exec_size) dst JIP</p>			
<b>Restriction</b>			<b>Project</b>
Restriction : The call instruction must have DWord source and destination type, and the destination must be QWord aligned.			
Restriction : The source0 regioning control must be < 2;2,1 > .			HSW
Restriction : The execution size must be 2.			HSW

## Branch Diverging

<b>brd - Branch Diverging</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
Description			Project
The brd instruction redirects the execution forward or backward to the instruction pointed by (current IP + offset). The jump will occur if any channels are branched away.			
In GEN binary, JIP is at location src1 when immediate and at location src0 when reg32, where reg32 is accessed as a scalar DWord. The ip register must be used (for example, by the assembler) as dst.			HSW

## Call Absolute

<b>calla - Call Absolute</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
<p>The calla instruction jumps to a subroutine. It can be predicated or non-predicated. If non-predicated, all enabled channels jump to the subroutine. If predicated, only the channels enabled by PMask jump to the subroutine; the rest of the channels move to the next instruction after the calla instruction. If none of the channels jump into the subroutine, the calla instruction is treated as a nop.</p> <p>In case of a jump, the call instruction stores the return IP onto the first DWord of the destination register and stores the CallMask in the second DWord of the destination register.</p> <p>If SPF is ON, none of the PcIP are updated.</p> <p>When SPF is on, the predication control must be scalar.</p> <p>The difference between calla and call is that calla uses JIP as the IP value rather than adding it to the IP value.</p>			
Format: [(pred)] calla (exec_size) dst JIP			
<b>Restriction</b>			<b>Project</b>
Restriction : The calla instruction must have DWord source and destination type, and the destination must be QWord-aligned.

## Break

<b>break - Break</b>							
Project:	HSW						
Source:	EuIsa						
Length Bias:	4						
Description			Project				
<p>The break instruction is used to early-out from the inner most loop, or early out from the inner most switch block.</p> <p>When used in a loop, upon execution, the break instruction terminates the loop for all execution channels enabled. If all the enabled channels hit the break instruction, jump to the instruction referenced by JIP. JIP should be the offset to the end of the inner most conditional or loop block, UIP should be the offset to the while instruction of the loop block.</p> <p>If SPF is ON, the UIP must be used to update IP; JIP is not used in this case</p>							
<p>The following table describes the two 16-bit instruction pointer offsets. Both the JIP and UIP are signed 16-bit numbers, added to IP pre-increment. In GEN binary, JIP and UIP are at location src1 and must be of type W (signed word integer).</p>			HSW

## While

<b>while - While</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
<b>Description</b>			<b>Project</b>
<p>The while instruction marks the end of a do-while block. The instruction first evaluates the loop termination condition for each channel based on the current channel enables and the predication flags specified in the instruction. If any channel has not terminated, a branch is taken to a destination address specified in the instruction, and the loop continues for those channels. Otherwise, execution continues to the next instruction. <i>ld</i> point to the first instruction with the do label of the do-while block of code. It should be a negative number for the backward referencing. In GEN binary, JIP is at location <i>dst</i> and must be of type W (signed word integer).</p> <p>If SPF is ON, none of the PcIP are updated.</p> <p>The following table describes the 16-bit jump target offset JIP. JIP is a signed 16-bit number, added to IP pre-increment, and should point to the first instruction with the do label of the do-while block of code. It should be a negative number for the backward referencing. In GEN binary, JIP is at location <i>src1</i> and must be of type W (signed word integer).</p>			
<p>Format:            [(pred)] while (exec_size) JIP</p>			
<b>Restriction</b>

## Wait Notification

<b>wait - Wait Notification</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
<p>The wait instruction evaluates the value of the notification count register nreg. If nreg is zero, thread execution is suspended and the thread is put in 'wait_for_notification' state. If nreg is not zero (i.e., one or more notifications have been received), nreg is decremented by one and the thread continues executing on the next instruction. If a thread is in the 'wait_for_notification' state, when a notification arrives, the notification count register is incremented by one. As the notification count register becomes nonzero, the thread wakes up to continue execution and at the same time the notification register is decremented by one. If only one notification arrived, the notification register value becomes zero. However, during the above mentioned time period, it is possible that more notifications may arrive, making the notification register nonzero again.</p> <p>When multiple notifications are received, software must use wait instructions to decrement notification count registers for each notification.</p> <p>Notification register n0.0:ud is for thread to thread communication (via the Message Gateway shared function) and n0.1:ud for host to thread communication (through MMIO registers). See the Message Gateway chapter for thread-thread communication and the Debug chapter for host-to-thread communication.</p>			
Format:	wait (exec_size) nreg		
<b>Restriction</b>			
Restriction : src0 and dst must be n0.0, n0.1, or n0.2.			
Restriction : Execution size must be 1 as the notification registers are scalar.			
Restriction : Predication is not allowed.			
Restriction : Two back-to-back wait instructions are not allowed. At minimum, a nop instruction must be inserted between two wait instructions

## Integer Subtraction with Borrow

<b>subb - Integer Subtraction with Borrow</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
<p>The subb instruction performs component-wise subtraction of src0 and src1 and stores the results in dst, it also stores the borrow into acc.</p> <p>If the operation produces a borrow (src0 &lt; src1), write 0x00000001 to acc, else write 0x00000000 to acc.</p>			
Format:	[(pred)] subb[.cmod] (exec_size) dst src0 src1		
<b>Restriction</b>			
Restriction : AccWrEn is required. The accumulator is an implicit destination and thus cannot be an explicit destination operand.			
<b>Syntax</b>			
[(pred)] subb[.cmod] (exec_size) reg reg reg [(pred)] subb[.cmod] (exec_size) reg reg imm32			
<b>Pseudocode</b>			
<pre>Evaluate(WrEn); for ( n = 0; n &lt; exec_size; n++ ) { if ( WrEn.chan[n] ) { dst.chan[n] = src0.chan[n] - src1.chan[n]; acc.chan[n] = borrow(src.chan[n] - src1.chan[n]); } }</pre>

## MI\_NOOP

<b>MI_NOOP</b>			
Project:	HSW		
Source:	VideoCS		
Length Bias:	1		
<p>The MI_NOOP command basically performs a "no operation" in the command stream and is typically used to pad the command stream (e.g., in order to pad out a batch buffer to a QWord boundary). However, there is one minor (optional) function this command can perform - a 22-bit value can be loaded into the MI NOPID register. This provides a general-purpose command stream tagging ("breadcrumb") mechanism (e.g., to provide sequencing information for a subsequent breakpoint interrupt).</p>

## Multiply

<b>mul - Multiply</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
Description			Project
The mul instruction performs component-wise multiplication of src0 and src1 and stores the results in dst.			
When both src0 and src1 are of type D or UD, only the low 16 bits of each element of src1 are used. The accumulator maintains full 48-bit precision. The macro described in the mach instruction should be used to obtain the full precision 64-bit multiplication result.			HSW
Multiplication of two floating-point numbers follows the rules in mul - Multiply based on the applicable floating-point mode.			
Format: [(pred)] mul[.cmod] (exec_size) dst src0 src1			
Restriction			Project
Restriction : Use a source modifier with add to implement subtraction.			
Restriction : When operating on integers with at least one of the source being a DWord type (signed or unsigned), the destination cannot be floating-point (implementation note: the data converter only looks at the low 34 bits of the result).			
Restriction : When operating on integers with at least one source having a DWord type (signed or unsigned), the Overflow and Sign flags are undefined. Therefore, conditional modifiers and saturation (.sat) cannot be used in this case.			
Restriction : When multiplying a DW and a W, the W has to be on src1, and the DW has to be on src0.			HSW
Syntax			
[(pred)] mul[.cmod] (exec_size) reg reg reg [(pred)] mul[.cmod] (exec_size) reg reg imm32			
Pseudocode			
Evaluate(WrEn); for ( n = 0; n < exec_size; n++ ) { if ( WrEn.chan[n] ) { dst.chan[n] = src0.chan[n] * src1.chan[n]; } }

## Move Indexed

<b>movi - Move Indexed</b>	
Project:	HSW
Source:	EuIsa
Length Bias:	4
<p>The movi instruction performs a fast component-wise indexed move for subfields from src0 to dst. The source operand must be an indirectly-addressed register. All channels of the source operand share the same register number, which is provided by the register field of the first address subregister, with a possible immediate register offset. The register fields of the subsequent address subregisters are ignored by hardware. The subregister number of a source channel is provided by the subregister field of the corresponding address subregister, with a possible immediate subregister offset.</p> <p>The destination register may be either a directly-addressed or an indirectly-addressed register.</p> <p>This instruction effectively performs a subfield shuffling from one register to another. Up to eight subfields can be selected by an instruction.</p>	
<p>Format:</p> <p>[(pred)] movi (exec_size) dst src0 src1</p>	
<b>Programming Notes</b>	
<p><b>HW Implementation Details:</b></p> <p>The source register is calculated by adding the register portion of the first index register with the register portion of the address immediate, <math>a0.0[11:5] + \text{addr\_imm}[9:5]</math></p> <p>For byte movi, byte0 of the destination is selected by <math>(a0.0[4:0])</math>, byte1 is selected by <math>(a0.1[4:0])</math>, ..., and byte7 is selected by <math>(a0.7[4:0])</math>. The rest of the bytes are undefined.</p> <p>For word movi, byte0 of the destination is selected by <math>(a0.0[4:1] \&amp; 0)</math>, byte1 is selected by <math>(a0.0[4:1] \&amp; 1)</math>, byte2 is selected by <math>(a0.1[4:1] \&amp; 0)</math>, byte3 is selected by <math>(a0.1[4:1] \&amp; 1)</math>, ..., and byte15 is selected by <math>(a0.7[4:1] \&amp; 1)</math>. The rest of the bytes are undefined.</p> <p>For DWord or float movi, byte0 of the destination is selected by <math>(a0.0[4:2] \&amp; 00b)</math>, byte1 is selected by <math>(a0.0[4:2] \&amp; 01b)</math>, byte2 is selected by <math>(a0.0[4:2] \&amp; 10b)</math>, byte3 is selected by <math>(a0.0[4:2] \&amp; 11b)</math>, byte4 is selected by <math>(a0.1[4:2] \&amp; 00b)</math>, byte5 is selected by <math>(a0.1[4:2] \&amp; 01b)</math>, ..., byte31 is selected by <math>(a0.7[4:2] \&amp; 11b)</math>.</p> <p>For all 3 conditions above, <math>a0.n[4:0] = a0.n[4:0] + \text{addr\_imm}[4:0]</math>.</p>	
<b>Restriction</b>	<b>Project</b>
Restriction : Source operand cannot be accumulators. The source operand must be a general register.	
Restriction : The source and destination must have the same type.	
Restriction : The execution size must be 8.	HSW
Restriction : The address register for the source must be aligned to the base (a0.0).	HSW
Restriction : The destination register (directly or indirectly addressed) must be 16-byte aligned.	
Restriction : The destination region (directly or indirectly addressed) must point to the same GRF	

## movi - Move Indexed

register.	
Restriction : The destination stride in bytes must equal the source element size in bytes.	
Restriction : The Align16 access mode is not allowed.	
Restriction : All the index registers (address subregisters) used must point to the same GRF register.	
Restriction : The instruction must use 1x1 indirect regioning.	
Restriction : The destination offset is only used to create channel enables. Each element of the destination is directly mapped to the index registers for the movi instruction. i.e. a0.0 -> dst.0, a0.1 -> dst.1, a0.2 -> dst.2, etc.	
Restriction : Conditional Modifier is not allowed for this instruction.	

### Syntax

`[(pred)] movi (exec_size) reg reg imm`

### Pseudocode

```
Evaluate(WrEn); srcregfile = regfile(src0); srcregbase = reg(address[0]) +
reg(addr_imm); for ( n = 0; n < RegWidth; n++ ) { if ( WrEn.chan[n] ) {
srcsubreg = subreg(address[n] + addr_imm); dst.chan[n] =
srcregfile.srcreg.srcsubreg; } }
```

## Multiply Accumulate High

### **mach - Multiply Accumulate High**

Project: HSW  
Source: EuIsa  
Length Bias: 4

The mach instruction performs DWord integer multiply-accumulate operation and outputs the high DWord (bits 63:32).

For each enabled channel, this instruction multiplies the DWord in src1 with the high word of the DWord in src0, left shifts the result by 16 bits, adds it with the corresponding accumulator values, and keeps the whole 64-bit result in the accumulator. It then stores the high DWord (bits 63:32) of the results in dst.

This instruction is intended to be used to emulate 32-bit DWord integer multiplication by using the large number of bits available in the accumulator. For example, the following four instructions perform vector multiplication of two 32-bit signed integer sources from r2 and r3 and store the resulting vectors with the high 32 bits in r5 and the low 32 bits in r6.

```
mul (8) acc0:d r2.0<8;8,1>:d r3.0<8;8,1>:d //All channels must be enabled
```

```
mach (8) rTemp<1>:d r2.0<8;8,1>:d r3.0<8;8,1>:d //All channels must be enabled
```

```
mov (8) r5.0<1>:d rTemp<8;8,1>:d // High 32 bits
```

```
mov (8) r6.0<1>:d acc0:d // Low 32 bits
```

The mul and mach instructions must have all channels enabled. The first mov should have channel enable from the destHI of IMUL, the second mov should have the channel enable from the destLO of IMUL.

As mach is used to generate part of the 64-bit DWord integer results, saturation modifier should not be used. In fact, saturation modifier should not be used for any of these four instructions.

Source and destination operands must be DWord integers. Source and destination must be of the same type, signed integer or unsigned integer.

If dst is UD, src0 and src1 may be UD and/or D. However, if any of src0 and src1 is D, source modifier (abs) must be present to convert it to match with dst.

If dst is D, src0 and src1 must also be D. They cannot be UD as it may cause unexpected overflow because the computed results are limited to 64 bits.

Format:  
[[pred]] mach[.cmod] (exec\_size) dst src0 src1

#### **Restriction**

## mach - Multiply Accumulate High

Restriction : Accumulator is an implicit source and thus cannot be an explicit source operand.

Restriction : AccWrEn is required. The accumulator is an implicit destination and thus cannot be an explicit destination operand.

### Syntax

```
[(pred)] mach[.cmod] (exec_size) reg reg reg [(pred)] mach[.cmod] (exec_size) reg
reg imm32
```

### Pseudocode

```
Evaluate(WrEn);
for ( n = 0; n < exec_size; n++ ) { acc.chan[n][63:0] = (src0.chan[n][31:16] *
src1.chan[n][31:0]) << 16 + acc.chan[n][63:0]; if ( WrEn.chan[n] ) {
dst.chan[n][31:0] = acc.chan[n][63:32]; } }
```

## Move

<b>mov - Move</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
<p>The mov instruction moves the components in src0 into the channels of dst. If src0 and dst are of different types, format conversion is performed. If src0 is a scalar immediate, the immediate value is loaded into enabled channels of dst.</p> <p>A mov with the same source and destination type, no source modifier, and no saturation is a raw move. A packed byte destination region (B or UB type with HorzStride == 1 and ExecSize &gt; 1) can only be written using raw move.</p> <p>When denorm mode is flush to zero, a raw mov instruction with saturation modifier will not flush the denorm input or output to zero (Denorm is preserved).</p> <p>Format:            [(pred)] mov[.cmod] (exec_size) dst src0</p>			
<b>Programming Notes</b>			<b>Project</b>
A <i>mov</i> instruction with a source modifier always copies a denorm source value to a denorm destination value (in the manner of a raw move).			HSW
There is no direct conversion from B/UB to DF or DF to B/UB. Use two instructions and a word or DWord intermediate type.			HSW
<b>Restriction</b>			
Restriction : Raw move is not supported for Float values in ALT mode if any values are infinities or NaNs.			
Restriction : An accumulator can be a source or destination operand but not both.			
<b>Syntax</b>			<b>Project</b>

## Extended Math Function

<b>math - Extended Math Function</b>	
Project:	HSW
Source:	EuIsa
Length Bias:	4
<p>The math instruction performs extended math function on the components in src0, or src0 and src1, and write the output to the channels of dst. The type of extended math function are based on the FC[3:0] encoding in the table below.</p>	
<p>Format:            [(pred)] math (exec_size) dst src0 src1 &lt;FC&gt;</p>	
Restriction	Project
Restriction : Accumulator access is allowed only for ieee macro functions.	
Restriction : The math instruction does not support indirect addressing modes.	
Restriction : The only supported rounding mode for math instruction is Round to Nearest Even.	
Restriction : INT DIV function does not support SIMD16.	
Restriction : The FDIV function is not supported in ALT_MODE.	
Restriction : The math instruction must use GRF registers as source(s) and destination.	HSW
Restriction : The supported regioning mode for math instruction is align1 with the following restrictions: Scalar source is supported. Source and destination horizontal stride must be 1. Width must be the same as execution size. Source and destination offset must be the same, except the case of scalar source.	HSW
Syntax	
[(pred)] math (exec_size) reg reg reg imm4	
Pseudocode

## Select

<b>sel - Select</b>	
Project:	HSW
Source:	EuIsa
Length Bias:	4
Description	Project
<p>The sel instruction selectively moves the components in src0 or src1 into the channels of dst based on the predication. On a channel by channel basis, if the channel condition is true, data in src0 is moved into dst. Otherwise, data in src1 is moved into dst.</p> <p>As the predication is used to select the two sources, it is not included in the evaluation of WrEn. The predicate clause is mandatory if cmod is omitted/0000b. If both predication and the conditional modifier are omitted, the results are undefined.</p> <p>If the conditional modifier is specified (not 0000b, a compare is performed and the resulting condition flag is used for the sel instruction. Conditional modifiers .ge and .l follow the cmpn rules, and all other conditional modifiers follow the cmp rules. Predication is not allowed in this mode.</p> <p>A sel instruction with cmod .l is used to emulate a MIN instruction.</p> <p>A sel instruction with cmod .ge is used to emulate a MAX instruction.</p> <p>For a sel instruction with a .l or .ge conditional modifier, if one source is NaN and the other not NaN, the non-NaN source is the result. If both sources are NaNs, the result is NaN. For all other conditional modifiers, if either source is NaN then src1 is selected.</p> <p>A sel instruction without a conditional modifier always copies a denorm source value to a denorm destination value (in the manner of a raw move).</p> <p>The sel instruction uses any conditional modifier internally and does not update the flag register if a conditional modifier is used.</p>	
A sel instruction with a conditional modifier flushes any selected denorm source value to a zero destination value.	HSW
Format: (pred) sel[.cmod] (exec_size) dst src0 src1	
Restriction	Project
Restriction : The maximum execution size is 16. SIMD32 is not supported.	HSW

## Plane

<b>pln - Plane</b>	
Project:	HSW
Source:	EuIsa
Length Bias:	4
<p>The pln instruction computes a component-wise plane equation (<math>w = p*u+q*v+r</math> where <math>u/v/w</math> are vectors and <math>p/q/r</math> are scalars) of src0 and src1 and stores the results in dst. src1 is the input vector u.</p> <p>src0 provides input scalars p, q, and r, where p is the scalar value based on the region description of src0 and q and r are the scalar values implied from the src0 region. Specifically, q is the second component and r is the fourth component of the 4-tuple (128-bit aligned) that p belongs to.</p>	
Format: [(pred)] pln[.cmod] (exec_size) dst src0 src1	
Restriction	Project
Restriction : This is a specialized instruction that only supports an execution size (ExecSize) of 8 or 16.	
Restriction : The src0 region must be a replicated scalar (with HorzStride == VertStride == 0).	
Restriction : src0 must specify .0 or .4 as the subregister number, corresponding to a subregister byte offset of 0 or 16.	
Restriction : Source operands cannot be accumulators.	HSW
Syntax	
[(pred)] pln[.cmod] (exec_size) reg reg reg	
Pseudocode	
<pre> Evaluate(WrEn); for ( n = 0; n &lt; exec_size; n++ ) {     float dwP = src0.RegNum.SubRegNum[bits4:2]; // A DWord-aligned scalar.     float dwQ = src0.RegNum.(SubRegNum[bit4:2]   0x1); // Second component.     float dwR = src0.RegNum.(SubRegNum[bit4:2]   0x3); // Fourth component.     if ( ExecSize == 8 ) {         u = src1.RegNum         v = src1.(RegNum + 1)     } else {         if ( n &lt; 8 ) {             u = src1.RegNum             v = src1.(RegNum + 1)         } else {             u = src1.(RegNum + 2)             v = src1.(RegNum + 3)         }     } }  if ( WrEn.chan[n] ) { </pre>	

## pln - Plane

```

dst.chan[n] = dwP * u.chan[n] + dwQ * v.chan[n] + dwR;
    }
}

```

## Round to Nearest or Even

<b>rnde - Round to Nearest or Even</b>			
Project:	HSW		
Source:	EuIsa		
Length Bias:	4		
<p>The rnde instruction takes component-wise floating point round-to-even operation of src0 with results in two pieces - a downward rounded integral float results stored in dst and the round-to-even increments stored in the rounding increment bits. The round-to-even increment must be added to the results in dst to create the final round-to-even values to emulate the round-to-even operation, commonly known as the round() function. The final results are the one of the two integral float values that is nearer to the input values. If the neither possibility is nearer, the even alternative is chosen.</p> <p>Each result follows the rules in the following tables based on the floating-point mode.</p>

## MI\_NOOP

<b>MI_NOOP</b>			
Project:	HSW		
Source:	VideoEnhancementCS		
Length Bias:	1		
<p>The MI_NOOP command basically performs a "no operation" in the command stream and is typically used to pad the command stream (e.g., in order to pad out a batch buffer to a QWord boundary). However, there is one minor (optional) function this command can perform - a 22-bit value can be loaded into the MI NOPID register. This provides a general-purpose command stream tagging ("breadcrumb") mechanism (e.g., to provide sequencing information for a subsequent breakpoint interrupt).</p>

	This field contains a 22-bit number which can be written to the MI NOPID register.		

## Send Message

<b>send - Send Message</b>	
Project:	HSW
Source:	EuIsa
Length Bias:	4
Description	Project
Send a message stored in GRF starting at <src> to a shared function identified by <ex_desc> along with control from <desc> with a GRF writeback location at <dest>.	HSW
The send instruction performs data communication between a thread and external function units, including shared functions (Sampler, Data Port Read, Data Port Write, URB, and Message Gateway) and some fixed functions (e.g. Thread Spawner, who also have an unique Shared Function ID). The send instruction adds an entry to the EU's message request queue. The request message is stored in a block of contiguous GRF registers. The response message, if present, will be returned to a block of contiguous GRF registers. The return GRF writes may be in any order depending on the external function units. <src> is the lead GRF register for request. <dest> is the lead GRF register for response. The message descriptor field <desc> contains the Message Length (the number of consecutive GRF registers) and the Response Length (the number of consecutive GRF registers). It also contains the header present bit, and the function control signals. The extend message descriptor field <ex_desc> contains the target function ID. WrEn is forwarded to the target function in the message sideband.	HSW
The send instruction is the only way to terminate a thread. When the EOT (End of Thread) bit of <ex_desc> is set, it indicates the end of thread to the EU, the Thread Dispatcher and, in most cases, the parent fixed function. Message descriptor field <desc> can be a 32-bit immediate, imm32, or a 32-bit scalar register, <reg32a>. GEN restricts that the 32-bit scalar register <reg32a> must be the leading dword of the address register. It should be in the form of a0.0<0;1,0>:ud. When <desc> is a register operand, only the lower 29 bits of <reg32a> are used.	HSW
<ex_desc> is a 6-bit immediate, imm6. The lower 4bits of the <ex_desc> specifies the SFID for the message. The MSb of the message descriptor, the EOT field, always comes from bit 127 of the instruction word, which is the MSb of imm6. A thread must terminate with a send instruction with EOT turned on.	HSW
<src> is a 256-bit aligned GRF register. It serves as the leading GRF register of the request.	HSW
<dest> serves for two purposes: to provide the leading GRF register location for the response message if present, and to provide parameters to form the channel enable sideband signals. <dest> signals whether there is a response to the message request. It can be either a null register, a direct-addressed GRF register or a register-indirect GRF register. Otherwise, hardware behavior is undefined. If <dest> is null, there is no response to the request. Meanwhile, the Response Length field in <desc> must be 0. Certain types of message requests, such as memory write (store) through the Data Port, do not want response data from the function unit. If so, the posted destination operand can be null. If <dest> is a GRF register, the register number is forwarded to the shared function. In this case, the	HSW

## send - Send Message

target function unit must send one or more response message phases back to the requesting thread. The number of response message phases must match the Response Length field in <desc>, which of course cannot be zero. For some cases, it could be an empty return message. An empty return message is defined as a single phase message with all channel enables turned off.

The subregister number, horizontal stride, destination mask and type fields of <dest> are always valid and are used in part to generate on the WrEn. This is true even if <dest> is a null register (this is an exception for null as for most cases these fields are ignored by hardware).

The 16-bit channel enables of the message sideband are formed based on the WrEn. Interpretation of the channel enable sideband signals is subject to the target external function. In general for a 'send' instruction with return messages, they are used as the destination dword write mask for the GRF registers starting at <dest>. For a message that has multiple return phases, the same set of channel enable signals applies to all the return phases.

Thread managed memory coherency: A special usage of using non-null <dest> is to support write-commit signaling for memory write service by the Data Port Write unit. If <post\_dest> is not null for a memory write request, the Data Port along with the Data Cache or Render Cache will wait until all the posted writes for the request have reached the coherent domain before sending back to the requesting thread an empty message to <dest> register. A memory write reaching the coherent domain, also referred to as reaching the global observable state, means that subsequent read to the same memory location, no matter which thread issues the read, must return the data of the write.

The destination dependency control, {NoDDClr}, can be used in this instruction. This allows software to control the destination dependencies for multiple 'read'-type messages similar to that for multiple instructions using EU execution pipeline. As send does not check register dependencies for the post destination, {NoDDChk} should not be used for this instruction.

### Restriction

### Project

Restriction : Software must obey the following rules in signaling the end of thread using the send instruction:

- The posted destination operand must be null.
- No acknowledgement is allowed for the send instruction that signifies the end of thread. This is to avoid deadlock as the EU is expecting to free up the terminated thread's resource.
- A thread must terminate with a send instruction with message to a shared function on the output message bus; therefore, it cannot terminate with a send instruction with message to the following shared functions: Sampler unit, NULL function
- For example, a thread may terminate with a URB write message or a render cache write message.
- A root thread originated from the media (generic) pipeline must terminate with a send instruction with message to the Thread Spawner unit. A child thread should also terminate with a send to TS. Please refer to the Media Chapter for more detailed description.
- The send instruction can not update accumulator registers.
- Saturate is not supported for send instruction.
- ThreadCtrl are not supported for send instruction.
- The send with EOT should use register space R112-R127 for <src>. This is to enable loading of a new thread into the same slot while the message with EOT for current thread is pending dispatch

## MI\_WAIT\_FOR\_EVENT

MI_WAIT_FOR_EVENT		
Project:	HSW	
Source:	BlitterCS	
Length Bias:	1	
<p>The MI_WAIT_FOR_EVENT command is used to pause command stream processing until a specific event occurs or while a specific condition exists. Only one event/condition can be specified -- specifying multiple events is UNDEFINED. The effect of the wait operation depends on the source of the command. If executed from a batch buffer, the parser will halt (and suspend command arbitration) until the event/condition occurs. If executed from a ring buffer, further processing of that ring will be suspended, although command arbitration (from other rings) will continue. Note that if a specified condition does not exist (the condition code is inactive) at the time the parser executes this command, the parser proceeds, treating this command as a no-operation. If execution of this command from a primary ring buffer causes a wait to occur, the active ring buffer will effectively give up the remainder of its time slice (required in order to enable arbitration from other primary ring buffers).</p>

## MI\_FLUSH

<b>MI_FLUSH</b>		
Project:	HSW	
Source:	RenderCS	
Length Bias:	1	
Description	Project	
<p>The MI_FLUSH command is used to perform an internal flush operation. The parser pauses on an internal flush until all drawing engines have completed any pending operations and the read caches are invalidated including the texture cache accessed via the Sampler or the data port. In addition, this command can also be used to:</p> <ul style="list-style-type: none"> <li>Flush any dirty data in the Render Cache to memory. This is done by default, however this can be inhibited.</li> <li>Invalidate the state and command cache.</li> </ul> <p><b>Usage Note:</b> After this command is completed and followed by a Store DWord-type command, CPU access to graphics memory will be coherent (assuming the Render Cache flush is not inhibited). This command is specific to the render engine. Other engines use MI_FLUSH_DW. To use this command, bit 12 in the MI_MODE(0x209c) must be enabled.</p>		
If GFX_MODE (0x229C) bit 13, this command will cause a config write to MMIO register space with the address 0x4f100.	HSW	
MI_FLUSH command is no longer validated or supported. Use at your own risk.	HSW	
DWord	Bit	Description
0	31:29	<b>Command Type</b>
		Default Value: 0h MI_COMMAND Format: OpCode
	28:23	<b>MI Command Opcode</b>
		Default Value: 04h MI_FLUSH Format: OpCode
22:7	<b>Reserved</b>	Format: MBZ
6	<b>Reserved</b>	
5	5	<b>Indirect State Pointers Disable</b>
		Format: Disable
<p>At the completion of the flush, the indirect state pointers in the hardware will be considered as invalid. I.e., the indirect pointers will not be restored for the context.</p>		

## MI\_FLUSH

4	<b>Generic Media State Clear</b>	
	Project:	HSW
	Format:	Disable
	<p>If set, all generic media state context information will not be included with the next context save, assuming no new state is initiated after the flush. If clear, the generic media state context save state will not be affected. An MI_FLUSH with this bit set should be issued once all the Media Objects that will be processed by a given persistent root thread have been issued or when an MI_SET_CONTEXT switching from a generic media context to a 3D context completes. When using MI_SET_CONTEXT, once state is programmed, it will be saved and restarted as part of any context each time that context is saved/restored until an MI_FLUSH with this bit set is issued in that context.</p>	
3	<b>Global Snapshot Count Reset</b>	
	Format:	Boolean
	<p>The Statistics Counters are also reset; SW should never set this bit during normal operation since the Statistics Counters are intended to be free running.</p>	
	<b>Value</b>	<b>Name</b>
	<b>Description</b>	
	0h	Don't Reset
	1h	Reset
	<p>Do not reset the snapshot counts or Statistics Counters.</p> <p>Reset the snapshot count in Gen4 for all the units and reset the Statistics Counters except as noted above.</p>	
	<b>Programming Notes</b>	
	<p>TIMESTAMP are not reset by MI_FLUSH with this bit set. TIMESTAMP and PS_DEPTH_COUNT can be reset by writing 0 to them.</p>	
2	<b>Render Cache Flush Inhibit</b>	
	Format:	Boolean
	<p>If set, the Render Cache is not flushed as part of the processing of this command.</p>	
	<b>Value</b>	<b>Name</b>
	<b>Description</b>	
	0h	Flush
	1h	Don't Flush
	<p>Flush the Render Cache.</p> <p>Do not flush the Render Cache.</p>	
1	<b>State/Instruction Cache Invalidate</b>	
	Format:	Boolean
	<p>If set, Invalidates the State and Instruction Cache.</p>	
	<b>Value</b>	<b>Name</b>
	<b>Description</b>	
	0h	Don't Invalidate
	1h	Invalidate
	<p>Leave State/Instruction Cache unaffected.</p> <p>Invalidate State/Instruction Cache.</p>	
0	<b>Reserved</b>	
	Format:	MBZ

## MI\_ARB\_CHECK

<b>MI_ARB_CHECK</b>		
Project:	HSW	
Source:	VideoCS	
Length Bias:	1	
<p>The MI_ARB_CHECK is used to check for a change in arbitration. If executed as part of a Ring Buffer the command checks the UHPTR valid bit and if set the head of the ring will jump to the value of the head pointer programmed in the UHPTR.</p>		
<b>Programming Notes</b>		
This instruction cannot be placed in a batch buffer.		
DWord	Bit	Description
0	31:29	<b>MI Instruction Type</b>
		Default Value: 0h MI_INSTRUCTION
		Format: OpCode
	28:23	<b>MI Instruction Opcode</b>
		Default Value: 05h MI_ARB_CHECK
		Format: OpCode
	22:0	<b>Reserved</b>
		Format: MBZ

## MI\_ARB\_CHECK

<b>MI_ARB_CHECK</b>		
Project:	HSW	
Source:	RenderCS	
Length Bias:	1	
<p>The MI_ARB_CHECK instruction is used to check the ring buffer double buffered head pointer (register UHPTR). This instruction can be used to pre-empt the current execution of the ring buffer. Note that the valid bit in the updated head pointer register needs to be set for the command streamer to be pre-empted.</p>		
<b>Programming Notes</b>		<b>Project</b>
<ul style="list-style-type: none"> <li>The current head pointer is loaded with the updated head pointer register independent of the location of the updated head.</li> <li>If the current head pointer and the updated head pointer register are equal, hardware will automatically reset the valid bit corresponding to the UHPTR.</li> <li>For pre-emption, the wrap count in the ring buffer head register is no longer maintained by hardware. The hardware updates the wrap count to the value in the UHPTR register.</li> </ul>		
This instruction can be in either a ring buffer or batch buffer.		HSW

## MI\_ARB\_ON\_OFF

MI_ARB_ON_OFF			
Project:	HSW		
Source:	RenderCS		
Length Bias:	1		
<p>The MI_ARB_ON_OFF instruction is used to disable/enable context switching. This instruction can be used to prevent submission of a new execlist from interrupting a command sequence, however lite restore preemption is allowed with in the arbitration disabled command execution zone. Note that context switching will remain disabled until re-enabled through use of this command.</p> <p>This command will also prevent a switch in the case of waiting on events, running out of commands. These will effectively hang the device if allowed to occur while arbitration is off (context switching is disabled.) This command should always be used as an off-on pair with the sequence of instructions to be protected from context switch between MI_ARB_OFF and MI_ARB_ON. Software must use this arbitration control with caution since it has the potential to increase the response time of the Render Engine to pre-emption requests. This is a privileged command; it will not be effective (will be converted to a no-op) if executed from within a non-privileged batch buffer.</p>

This field enables or disables context switches due to pre-emption (a new execlist).			

## MI\_ARB\_ON\_OFF

MI_ARB_ON_OFF							
Project:	HSW						
Source:	VideoCS						
Length Bias:	1						
<p>The MI_ARB_ON_OFF instruction is used to disable/enable context switching. This instruction can be used to prevent submission of a new execlist from interrupting a command sequence, however lite restore preemption is allowed with in the arbitration disabled command execution zone. Note that context switching will remain disabled until re-enabled through use of this command.</p> <p>This command will also prevent a switch in the case of waiting on events, running out of commands. These will effectively hang the device if allowed to occur while arbitration is off (context switching is disabled.) This command should always be used as an off-on pair with the sequence of instructions to be protected from context switch between MI_ARB_OFF and MI_ARB_ON. Software must use this arbitration control with caution since it has the potential to increase the response time of the Render Engine to pre-emption requests. This is a privileged command; it will not be effective (will be converted to a no-op) if executed from within a non-privileged batch buffer.</p>

## MI\_URB\_ATOMIC\_ALLOC

MI_URB_ATOMIC_ALLOC			
Project:	HSW		
Source:	RenderCS		
Length Bias:	1		
This command is used to specify the region in URB allocated for URB atomic value storage. <b>This command is specific to the Render command stream only.</b>			
<b>Programming Notes</b>			
This command can only be sent after a flush has occurred.			
DWord	Bit	Description	
0	31:29	<b>Command Type</b>	
		Default Value:	0h MI_COMMAND
		Format:	OpCode
	28:23	<b>MI Command Opcode</b>	
		Default Value:	09h MI_URB_ALLOC
		Format:	OpCode
	22:20	<b>Reserved</b>	
		Format:	MBZ
	19:12	<b>URB Atomic Storage Offset</b>	
		Format:	U8 Number of 128B Entries
		This field specifies the offset of a 128B granular starting address in the URB. The value of <b>URB Atomic Storage Offset</b> plus the value of the <b>URB Atomic Storage Size</b> must not exceed 256.	
		<b>Value</b>	<b>Name</b>
	[0,255]		0-(32KB-128B)
11:9	<b>Reserved</b>		
	Format:	MBZ	
8:0	<b>URB Atomic Storage Size</b>		
	Format:	U9 Number of 128B Entries	
	This field specifies the size of the buffer in the URB in number of 128B entries. If this field has a value of zero then the URB Atomic allocation is disabled and will not be context save/restored.		
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	[0,256]		0-32KB

## MI\_PREDICATE

MI_PREDICATE				
Project:	HSW			
Source:	RenderCS			
Length Bias:	1			
DWord	Bit	Description		
0	31:29	<b>Command Type</b>		
		Default Value:	0h MI_COMMAND	
		Format:	OpCode	
	28:23	<b>MI Command Opcode</b>		
		Default Value:	0Ch MI_PREDICATE	
		Format:	OpCode	
	22:8	<b>Reserved</b>		
		Format:	MBZ	
	7:6	<b>Load Operation</b>		
		This field controls if/how the Predicate state bit is modified.		
		<b>Value</b>	<b>Name</b>	<b>Description</b>
		0h	LOADOP_KEEP	The Predicate state bit is unmodified.
1h		Reserved		
2h		LOADOP_LOAD	The Predicate state bit is loaded with the combine operation result.	
3h	LOADOP_LOADINV	The Predicate state bit is loaded with the inverted combine operation result.		
5	<b>Reserved</b>			
	Format:	MBZ		
4:3	<b>Combine Operation</b>			
	This field controls if/how the result of the compare operation is combined with the current Predicate state bit.			
	<b>Value</b>	<b>Name</b>	<b>Description</b>	
	0h	COMBINEOP_SET	The combine operation output the compare result unmodified.	
	1h	COMBINEOP_AND	The combine operation outputs the AND of the compare result and the current Predicate state bit.	
	2h	COMBINEOP_OR	The combine operation outputs the OR of the compare result and the current Predicate state bit.	
3h	COMBINEOP_XOR	The combine operation outputs the XOR of the compare result and		

<b>MI_PREDICATE</b>		
		the current Predicate state bit.
2	<b>Reserved</b>	
	Format:	MBZ
1:0	<b>Compare Operation</b> This field controls how Data DWord 0 and Data DWord 1 fields are used to generate a compare operation result and possibly modify the PredicateData register.	
	<b>Value</b>	<b>Name</b>
		<b>Description</b>
	0h	COMPAREOP_TRUE The compare operation outputs TRUE. The PredicateData register is unmodified.
	1h	COMPAREOP_FALSE The compare operation outputs FALSE. The PredicateData register is unmodified.
	2h	COMPAREOP_SRCS_EQUAL (MItemp0 - MItemp1) is computed and loaded into the PredicateData register. The compare operation outputs (MItemp0 == MItemp1).
	3h	COMPAREOP_DELTAS_EQUAL (MItemp0 - MItemp1) is computed and compared to the PredicateData register. If the values are equal, the compare operation outputs TRUE, otherwise it outputs FALSE. The PredicateData register is unmodified.

## MI\_TOPOLOGY\_FILTER

MI_TOPOLOGY_FILTER			
Project:	HSW		
Source:	RenderCS		
Length Bias:	1		
<p>This command is used to specify a specific 3DPrimType value, where the CS will ignore all 3DPRIMITIVE commands that do not have a matching 3DPrimType. This primitive culling is optional (turned off by using this command with a Topology Filter Value of 0). <b>This command is specific to the Render command stream only.</b></p>			
DWord	Bit	Description	
0	31:29	<b>Command Type</b>	
		Default Value:	0h MI_COMMAND
		Format:	OpCode

Length Bias:	2		
<p>The MI_LOAD_SCAN_LINES_EXCL command is used to initialize the Scan Line Window registers for a specific Display Pipe. If the display refresh is <b>outside</b> this window the Display Engine asserts a signal that is used by the command parser to process the WAIT_FOR_EVENT command (i.e., the parser will wait while outside). This command overrides the Scan Line Window defined by any previous MI_LOAD_SCAN_LINES_INCL or MI_LOAD_SCAN_LINES_EXCL commands targeting the specific display pipe.</p> <p><b>Note:</b> The two scan-line numbers are inclusive. If programmed to the same values, that single line defines the region in question.</p> <p>Always place an even number of MI_LOAD_SCAN_LINES_EXCL/INCL at a time into the ring buffer. If only a single MI_LOAD_SCAN_LINES_EXCL/INCL is desired, just add a second identical MI_LOAD_SCAN_LINES_EXCL/INCL command.</p>

## MI\_DISPLAY\_FLIP

<b>MI_DISPLAY_FLIP</b>	
Project:	HSW
Source:	BlitterCS
Length Bias:	2
<p>The MI_DISPLAY_FLIP command is used to request a specific display plane to switch (flip) to display a new buffer. The buffer is specified with a starting address and pitch. The tiled attribute of the buffer start address is programmed as part of the packet.</p>	
<p>The operation this command performs is also known as a "display flip request" operation - in that the flip operation itself will occur at some point in the future. This command specifies when the flip operation is to occur: either synchronously with vertical retrace to avoid tearing artifacts</p>	
<b>Programming Notes</b>	<b>Project</b>
<p>This command simply requests a display flip operation -- command execution then continues normally. There is no guarantee that the flip (even if asynchronous) will occur prior to subsequent commands being executed. (Note that completion of the MI_FLUSH_DW command does not guarantee that outstanding flip operations have completed). The MI_WAIT_FOR_EVENT command must be used to provide this synchronization to avoid back to back MI_DISPLAY_FLIP commands to the same display plane - by pausing command execution until a pending flip has actually completed. This synchronization can also be performed by use of the Display Flip Pending hardware status. See Display Flip Synchronization in the Device Programming Interface chapter of MI Functions.</p>	
<p>After a display flip operation is requested, software is responsible for initiating any required synchronization with subsequent buffer clear or blitter operations. For multi-buffering (e.g., double buffering) operations, this will typically require updating SURFACE_STATE or the binding table to change the blitter (back) buffer. In addition, prior to any subsequent clear or blitter operations, software must typically ensure that the new blitter buffer is not actively being displayed. Again, the MI_WAIT_FOR_EVENT command or Display Flip Pending hardware status can be used to provide this synchronization. See Display Flip Synchronization in the Device Programming Interface chapter of MI Functions.</p>	
<p>The display buffer command uses the X and Y offset for the tiled buffers from the Display Interface registers. Software is allowed to change the offset via the MMIO interface irrespective of the flip commands enqueued in the command stream. For tiled buffers, the display subsystem uses the X and Y offset in generation of the final request to memory. The offset is always updated on the next vblank for both Synchronous and Asynch Flips. It is not necessary to have a flip enqueued to update the X and Y offset</p>	
<p>The display buffer command uses the linear DWord offset for the linear buffers from the Display Interface registers. Software is allowed to change the offset via the MMIO interface irrespective of the flip commands enqueued in the command stream. For linear buffers, the display subsystem uses the Dword offset in generation of the final request to memory.</p> <ul style="list-style-type: none"> <li>• For synchronous flips the offset is updated on the next vblank. It is not necessary to have a sync</li> </ul>	

## MI\_DISPLAY\_FLIP

flip enqueued to update the DWord offset.

- Linear memory does not support asynchronous flips.

Events must be unmasked in the Display Engine Render Response Mask Register (DE RRMR 0x44050) prior to waiting for them with a MI\_WAIT\_FOR\_EVENT command, or in the case of flips or scanlines, prior to starting the flip or loading the scanline. Unmasked events will wake command streamer as they occur, so for improved power savings it is recommended to only unmask events that are required. Programming the DE RRMR register can be done through MMIO or a LOAD\_REGISTER\_IMMEDIATE command.

## MI\_DISPLAY\_FLIP

1:0

### Flip Type

Project: DevHSW+

This field specifies whether the flip operation should be performed asynchronously to vertical retrace.

Value	Name	Description	Project
00b	Sync Flip <b>[Default]</b>	The flip will occur during the vertical blanking interval - thus avoiding any tearing artifacts.	All
01b	Async Flip	The flip will occur "as soon as possible" - and may exhibit tearing artifacts	All

### Programming Notes

- The Display Buffer Pitch and Tile parameter cannot be changed for asynchronous flips (i.e., the new buffer must have the same pitch/tile format as the previous buffer).
- Async flips are supported on X-Tiled Frame buffers only.
- For Asynch Flips the Buffers used must be 32KB aligned.
- Asynch flips are supported on Display Planes A and B and C only.

## MI\_SEMAPHORE\_MBOX

MI_SEMAPHORE_MBOX			
Project:	HSW		
Source:	BlitterCS		
Length Bias:	2		
Description		Project	
<p>MI_SEMAPHORE_MBOX command provides capability in Blitter Engine to wait conditionally until a given synchronization register gets updated with a value greater than the "SEMAPHORE_DATA_DWORD" mentioned inline in this command. Synchronization registers can be updated through CPU MMIO access or through execution of MI_LOAD_REGISTER_IMM command in other engines. Synchronization between contexts (especially between contexts running on 2 different engines) is provided by the MI_SEMAPHORE_MBOX command.</p>			
<p>If execution is stalled due to this command, the engine will specify that the engine is IDLE to the power management engine.</p>		HSW

## MI\_SET\_CONTEXT

<b>MI_SET_CONTEXT</b>					
Project:	HSW				
Source:	RenderCS				
Length Bias:	2				
<p>The MI_SET_CONTEXT command is used to specify the <i>logical</i> context associated with the hardware context. A logical context is an area in memory used to store hardware context information, and the context is referenced via a 2KB-aligned pointer. If the (new) logical context is different (i.e., at a different memory address), the device saves the current HW context values to the current logical context address, and then restores (loads) the new logical context by reading the context from the new address and loading it into the hardware context state. If the logical context address specified in this command matches the current logical context address, this command is effectively treated as a NOOP. <b>Specific to the Render command stream only.</b></p> <p>This command also includes some controls over the context save/restore process.</p> <ul style="list-style-type: none"> <li>• The <b>Force Restore</b> bit can be used to refresh the on-chip device state from the same memory address if the indirect state buffers have been modified.</li> <li>• The <b>Restore Inhibit</b> bit can be used to prevent the new context from being loaded at all. This must be used to prevent an uninitialized context from being loaded. Once software has initialized a context (by setting all state variables to initial values via commands), the context can then be stored and restored normally.</li> <li>• This command is legal only if <b>Execlist Enable</b> in the GFX_MODE register is reset. Otherwise, execlists must be used to switch context in lieu of MI_SET_CONTEXT.</li> <li>• This command needs to be always followed by a single MI_NOOP instruction to correct a silicon issue.</li> <li>• When switching from a generic media context to a 3D context, the generic media state must be cleared via the Generic Media State Clear bit 16 in PIPE_CONTROL (or bit 4 in MI_FLUSH) before saving 3D context.</li> <li>• MI_SET_CONTEXT commands are permitted only within a ring buffer (not within a batch buffer).</li> </ul>					
<b>Programming Notes</b>					
<p>MI_ARB_ON_OFF with 'Arbitration Enable Reset' set should be programmed before an MI_SET_CONTEXT command. MI_ARB_ON_OFF with 'Arbitration Enable' set should be programmed after an MI_SET_CONTEXT command. This programming ensures that PSMI context switch flows do not conflict with MI_SET_CONTEXT flows.</p>

## MI\_SET\_CONTEXT

		Data Formats chapter is saved as part of switching away from this logical context. This bit will be stored in the associated CCID register to control the context save operation when switching away from this context (as part of a subsequent MI_SET_CONTEXT command).								
2	<b>Resource Streamer State Restore Enable</b>	<table border="1" style="width: 100%;"> <tr> <td style="width: 50%;">Project:</td> <td>DevHSW+</td> </tr> <tr> <td>Format:</td> <td>Enable</td> </tr> </table> <p>If set, the resource streamer state identified in the Logical Context Data section of the Memory Data Formats chapter is loaded (or restored) as part of switching to this logical context. This bit affects the switch (if required) to the context specified in Logical Context Address. This bit will also be stored in the associated CCID register to control a subsequent context save operation when switching to this context (as part of a subsequent ring buffer switch).</p> <table border="1" style="width: 100%;"> <thead> <tr> <th style="text-align: center;">Programming Notes</th> <th style="text-align: center;">Project</th> </tr> </thead> <tbody> <tr> <td>Resource Streamer State Restore Enable bit should be set when Resource Streamer State Save Enable is set irrespective of Restore Inhibit set.</td> <td style="text-align: center;">HSW</td> </tr> </tbody> </table>	Project:	DevHSW+	Format:	Enable	Programming Notes	Project	Resource Streamer State Restore Enable bit should be set when Resource Streamer State Save Enable is set irrespective of Restore Inhibit set.	HSW
Project:	DevHSW+									
Format:	Enable									
Programming Notes	Project									
Resource Streamer State Restore Enable bit should be set when Resource Streamer State Save Enable is set irrespective of Restore Inhibit set.	HSW									
1	<b>Force Restore</b>	When switching to this logical context a comparison between Logical Context Address and the contents of the CCID register is performed. Normally, matching addresses prevent a context restore from occurring; however, when this bit is set a context restore is forced to occur. This bit cannot be set with Restore Inhibit. Note: This bit is not saved in the associated CCID register. It only affects the processing of this command.								
0	<b>Restore Inhibit</b>	If set, the restore of the HW context from the logical context specified by Logical Context Address is inhibited (i.e., the existing HW context values are maintained). This bit must be used to prevent the loading of an uninitialized logical context. If clear, the context switch proceeds normally. This bit cannot be set with Force Restore. Note: This bit is not saved in the associated CCID register. It only affects the processing of this command.								

## MI\_URB\_CLEAR

<b>MI_URB_CLEAR</b>		
Project:	HSW	
Source:	RenderCS	
Length Bias:	2	
The MI_URB_CLEAR command allows SW to clear (write zero) to a section in the URB.		
<b>Programming Notes</b>		<b>Project</b>
<ul style="list-style-type: none"> <li>The command temporarily halts command execution.</li> <li>This command is part of context save/restore. Only the last instance will be part of context.</li> <li>This command requires the 3D pipeline to be flushed before execution.</li> </ul>		
MI_URB_CLEAR must be programmed following MI_SET_CONTEXT and before workload is submitted, when a given context expects URB locations to be initialized to 0x0.		HSW

## MI\_MATH

<b>MI_MATH</b>		
Project:	HSW	
Source:	RenderCS	
Length Bias:	2	
<b>Description</b>		<b>Project</b>
<p>The MI_MATH command allows SW to send instruction to ALU in Render Command Streamer. MI_MATH command is the means by which ALU can be accessed. ALU instructions form the data payload of MI_MATH command, ALU instruction is dword in size. MI_MATH Dword Length should be programmed based on the number of ALU instruction packed, max number is limited by the max Dword Length supported. When MI_MATH command is parsed by command streamer it outputs the payload dwords (ALU instructions) to the ALU. ALU takes single clock to process any given instruction. Refer to B-spec "Command Streamer (CS) ALU Programming" section in Command Streamer Programming.</p>		
This command is specific to the Render command stream only.		HSW

## MI\_STORE\_DATA\_IMM

MI_STORE_DATA_IMM			
Project:	HSW		
Source:	VideoEnhancementCS		
Length Bias:	2		
<p>The MI_STORE_DATA_IMM command requests a write of the QWord or DWord constant supplied in the packet to the specified Memory Address. As the write targets a System Memory Address, the write operation is coherent with the CPU cache (i.e., the processor cache is snooped).</p>			
<b>Programming Notes</b>			
<p>This command should not be used within a "non-secure" batch buffer to access global virtual space. Doing so will cause the command parser to perform the write with byte enables turned off. This command can be used within ring buffers and/or "secure" batch buffers. If used within a non-secure batch buffer, <b>Use Global GTT</b> must be clear.</p> <p>This command can be used for general software synchronization through variables in cacheable memory (i.e., where software does not need to poll un-cached memory or device registers).</p> <p>This command simply initiates the write operation with command execution proceeding normally. Although the write operation is guaranteed to complete "eventually", there is no mechanism to synchronize command execution with the completion (or even initiation) of these operations.</p>

## MI\_STORE\_DATA\_IMM

MI_STORE_DATA_IMM			
Project:	HSW		
Source:	BlitterCS		
Length Bias:	2		
<p>The MI_STORE_DATA_IMM command requests a write of the QWord constant supplied in the packet to the specified Memory Address. As the write targets a System Memory Address, the write operation is coherent with the CPU cache (i.e., the processor cache is snooped).</p>			
<b>Programming Notes</b>			
<p>This command can be used for general software synchronization through variables in cacheable memory (i.e., where software does not need to poll un-cached memory or device registers). However, the cacheable nature of the transaction is determined by the setting of the "mapping type" in the GTT entry. This command simply initiates the write operation with command execution proceeding normally. Although the write operation is guaranteed to complete "eventually", there is no mechanism to synchronize command execution with the completion (or even initiation) of these operations. All writes to memory generated using this command are expected to finish in order.</p>

## MI\_UPDATE\_GTT

<b>MI_UPDATE_GTT</b>				
Project:	HSW			
Source:	VideoCS			
Length Bias:	2			
<p>The MI_UPDATE_GTT command is used to update GTT page table entries in a coherent manner and at a predictable place in the command flow. An MI_FLUSH should be placed before this command, because work associated with preceding commands that are still in the pipeline may be referencing GTT entries that will be changed by its execution. The flush will also invalidate TLBs and read caches that may become invalid as a result of the changed GTT entries. MI_FLUSH is not required if it can be guaranteed that the pipeline is free of any work that relies on changing GTT entries (such as MI_UPDATE_GTT contained in a paging DMA buffer that is doing only update/mapping activities and no rendering). This is a privileged command.</p> <p>This command is converted to a no-op and an error is flagged if it is executed from within a non-secure (PPGTT) batch buffer when execlists are enabled. Note that when execlists are disabled, this command can be executed from a PPGTT batch buffer.</p>

2..3 <b>Project:</b> DevHSW	31:0	<b>Immediate Data</b>	
		Project:	HSW
		This field specifies the DWord value to be written to the targeted location. DW2 is the lower DW if QW is desired. Only valid when 15:14 in header is set to 1h	

## MI\_FLUSH\_DW

		Drivers cannot send a QW write when bit 5 of the address is '1'
--	--	---

## MI\_FLUSH\_DW

MI_FLUSH_DW		
Project:	HSW	
Source:	VideoCS	
Length Bias:	2	
<p>The MI_FLUSH_DW command is used to perform an internal "flush" operation. The parser pauses on an internal flush until all drawing engines have completed any pending operations. In addition, this command can also be used to: Flush any dirty data to memory. Invalidate the TLB cache inside the hardware Usage note: After this command is completed with a Store DWord enabled, CPU access to graphics memory will be coherent (assuming the Render Cache flush is not inhibited).</p>		
DWord	Bit	Description
0	31:29	<b>Command Type</b>
		Default Value: 0h MI_COMMAND

## MI\_CLFLUSH

MI_CLFLUSH			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
Flushes out the page given in the command out to system memory. This command is specific to the render engine. This command is not privileged.			
DWord	Bit	Description	
0	31:29	<b>Command Type</b>	
		Default Value:	0h MI_COMMAND
		Format:	OpCode
	28:23	<b>MI Command Opcode</b>	
		Default Value:	27h Store DW MI_CLFLUSH
		Format:	OpCode
	22	<b>Use Global GTT</b>	
		This bit will be ignored and treated as if clear when executing from a non-privileged batch buffer. It is allowed for this bit to be clear when executing this command from a privileged (secure) batch buffer. This bit must be 1 if the <b>Per Process GTT Enable</b> bit is clear.	
		<b>Value</b>	<b>Name</b>
			<b>Description</b>
0h	Per Process Graphics Address		
1h	Global Graphics Address	This command will use the global GTT to translate the Address and this command must be executing from a privileged (secure) batch buffer.	
21:10	<b>Reserved</b>		
	Format:	MBZ	
9:0	<b>DWord Length</b>		
	Default Value:	1h	
	Format:	=n Total Length - 2. Excludes DWord (0,1).	
	<b>Programming Notes</b>		
	The value of this field must not exceed a value 3Fh when programmed in a batch buffer with resource streamer enabled.	<b>Project</b> HSW	
1	31:12	<b>Page Base Address</b>	
		Format:	GraphicsAddress[31:12]
		4KB aligned Page Address which software requires hardware to flush to DRAM.	

<b>MI_CLFLUSH</b>				
	11:6	<b>Starting Cacheline Offset</b> Format: U6 Zero based starting cacheline offset to the Page Base Address.		
	5:0	<b>Reserved</b> Format: MBZ		
2	31:16	<b>Reserved</b> Format: MBZ		
	15:0	<b>Page Base Address High</b> Format: GraphicsAddress[47:32] This field specifies the 4GB aligned base address of gfx 4GB virtual address space within the host's 64-bit virtual address space.		
3..n	31:0	<b>DW Representing a Half Cache Line</b> Format: MBZ The information given to hardware is the DW itself, not the contents. Hardware uses the DW count of the command to determine the offset from the base to flush out. The offset is ½ cache line (8 DW = 1HW) granular so for a full page, the command will need 4096 bytes / 4 bytes per DW / 8 DW per HW = 128 DW. <table border="1" style="width: 100%; margin-top: 10px;"> <tr> <td style="text-align: center;"><b>Programming Notes</b></td> </tr> <tr> <td>Always even number of "DW Representing 1/2 cacheline" terms must be programmed.</td> </tr> </table>	<b>Programming Notes</b>	Always even number of "DW Representing 1/2 cacheline" terms must be programmed.
<b>Programming Notes</b>				
Always even number of "DW Representing 1/2 cacheline" terms must be programmed.				

## MI\_LOAD\_REGISTER\_MEM

<b>MI_LOAD_REGISTER_MEM</b>			
Project:	HSW		
Source:	RenderCS, BlitterCS, VideoCS, VideoEnhancementCS		
Length Bias:	2		
The MI_LOAD_REGISTER_MEM command requests from a memory location and stores that DWord to a register.			
Programming Notes	Project		
The command temporarily halts commands that will cause cycles down the 3D pipeline.			
The following addresses should NOT be used for LRIs: <ul style="list-style-type: none"> <li>• 0x8800 - 0x88FF</li> <li>• &gt;= 0xC0000</li> </ul> Limited LRI cycles to the Display Engine (0x40000-0xBFFFF) are allowed, but must be spaced to allow only one pending at a time. This can be done by issuing an SRM to the same address immediately after each LRI.			
Any updates to the memory location exercised by this command must be ensured to be coherent in memory prior to programming of this command. This must be achieved by programming "16" dummy MI_STORE_DATA_IMM (write to scratch space) commands prior to programming of this command. Example: MI_STORE_REGISTER_MEM (0x2288, 0x2CF0_0000) ..... ..... MI_STORE_DATA_IMM (16 times) (Dummy data, Scratch Address) MI_LOAD_REGISTER_MEM(0x2288, 0x2CF0_0000)	HSW

Project:		All					
Format:	MBZ						

## MI\_LOAD\_REGISTER\_REG

MI_LOAD_REGISTER_REG			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
The MI_LOAD_REGISTER_REG command reads from a source register location and writes that value to a destination register location.			
<b>Programming Notes</b>			
The command temporarily halts commands that will cause cycles down the 3D pipeline.			
Destination register with mask implemented (Ex: All chicken bit registers have bits [31:16] as mask bits and bits[15:0] as data) will not get updated unless the value read from source register has the bits corresponding to the mask bits set. Note that any mask implemented register when read returns "0" for the bits corresponding to mask location. When the source and destination are mask implemented registers, destination register will not get updated with the source register contents.

## MI\_BATCH\_BUFFER\_START

	Format:	MBZ
--	---------	-----

## MI\_BATCH\_BUFFER\_START

<b>MI_BATCH_BUFFER_START</b>		
Project:	HSW	
Source:	RenderCS	
Length Bias:	2	
<p>The MI_BATCH_BUFFER_START command is used to initiate the execution of commands stored in a batch buffer. For restrictions on the location of batch buffers, see Batch Buffers in the Device Programming Interface chapter of MI Functions.</p>		
<b>Programming Notes</b>		
<p>It is essential that the address location beyond the current page be populated inside the GTT. HW performs over-fetch of the command addresses and any over-fetch requires a valid TLB entry. A single extra page beyond the batch buffer is sufficient. Prior to sending batch buffer start command with clear command buffer enable set, software has to ensure pipe is flushed explicitly by sending MI_FLUSH.</p>		
<b>Note:</b>		
<p>SW must program 3DSTATE_CC_STATE_POINTERS command at the end of every 3D batch buffer followed by a PIPE_CONTROL with RC flush and CS stall. SW must also program these commands following preemption as part of the preemption sequence before workload is submitted for execution. Example below shows the 3DSTATE_CC_STATE_POINTERS and PIPECONTROL commands programmed at the end of the 3D batch buffer.</p> <p>Batch Start            State For Workload            Workload            Pipe Control Flush  <b>3DSTATE_CC_STATE_POINTERS // Command due to alternative procedure</b>  <b>PipeControl Flush -Stalling, RC Flush //Command due to alternative procedure</b>            End Batch Buffer</p>

----------	--

10 **Resource Streamer Enable**

Project:	DevHSW+
Format:	Enable

When this bit is set, the Resource Streamer will execute the batch buffer. When this bit is clear the Resource Streamer will not execute the batch buffer.

9 **Reserved**

8 **Address Space Indicator**

	Description	Project
	SW must ensure the "Address Space Indicator" of the chained batch buffer to be same as the initial batch buffer. Ex: If the MI_BATCH_BUFFER_START executed from Ring Buffer has "Address Space Indicator" as "PPGTT" then all subsequent chained batch buffers (not second level Batch Buffers) must be in "PPGTT". Not complying to above programming will result in unknown behavior of HW. Second level batch buffer can select its "Address space Indicator" independent of the parent batch buffer.	HSW
	This field must be '0' unless the Per-Process GTT Enable is '1'	
	For second level batch buffer, this field is not inherited from parent batch buffer and can be configured independently. Ex: MI_BATCH_BUFFER_START command with "2nd level batch buffer" attribute set	HSW

## MI\_BATCH\_BUFFER\_START

		can have address space indicator set to GGTT/PPGTT irrespective of the Address Space Indicator of the batch buffer from which it is invoked.

## XY\_SRC\_COPY\_BLT

XY_SRC_COPY_BLT	
Project:	HSW
Source:	BlitterCS
Length Bias:	2
<p>This BLT instruction performs a color source copy where the only operands involved is a color source and destination of the same bit width.</p> <p>The source and destination operands may overlap, which means that the X and Y directions can be either forward or backwards. The BLT Engine takes care of all situations. The base addresses plus the X and Y coordinates determine if there is an overlap between the source and destination operands. If the base addresses of the source and destination are the same and the Source X1 is less than Destination X1, then the BLT Engine performs the accesses in the X-backwards access pattern. There is no need to look for an actual overlap. If the base addresses are the same and Source Y1 is less than Destination Y1, then the scan line accesses start at Destination Y2 with the corresponding source scan line and the strides are subtracted for every scan line access.</p> <p>The ROP value chosen must involve source and no pattern data in the ROP operation.</p>	
Programming Notes	Project
<p>This command should not be used if <b>all</b> of the following conditions are met. Either use alternative methods such as Scratch and temporary memory or break up the BLT commands to avoid this issue.</p> <ul style="list-style-type: none"><li>• Source Y1 == Destination Y1 - Explanation: Source and Destination start pixel Y coordinates (Source(Y1), Destination(Y1)) are same (that is Source and Destination planes are not vertically shifted to each other, but are aligned)</li><li>• Source X1 &gt; Destination X1 - Explanation: Destination start pixel X1, is at left (i.e. left shifted) from the Source start pixel X1. In other words, Source (X1) is &gt; Destination (X1)</li><li>• Source X1 Virtual Address[31:5] == Destination X1 Virtual Address[31:5] - Explanation: SRC X1 1/2 cacheline virtual address = DST X1 1/2 cacheline virtual address</li><li>• Destination X2 Virtual Address[31:5] != Destination X1 Virtual Address[31:5] - Explanation: DST X2 1/2 cacheline virtual address Not equal to DST X1 1/2 cacheline virtual address.</li></ul>	HSW

## XY\_SRC\_COPY\_BLT

**Driver Alternative Procedure:** The driver can work around this issue by separating blit operations into two separate blits. The driver can achieve this by:

2. Blit 1: Copying the source to another temporary surface which does not overlap with the source (by giving it a different Base Address)
3. Blit 2: Copying that temporary surface to the original destination surface which obviously will also not be overlapping.

## XY\_MONO\_SRC\_COPY\_BLT

XY_MONO_SRC_COPY_BLT			
Project:	HSW		
Source:	BlitterCS		
Length Bias:	2		
<p>This BLT instruction performs a monochrome source copy where the only operands involved is a monochrome source and destination. The source and destination operands cannot overlap therefore the X and Y directions are always forward.</p> <p>All non-text monochrome sources are word aligned. At the end of a scan line of monochrome source, all bits until the next word boundary are ignored. The monochrome source data bit position field [2:0] indicates the bit position within the first byte of the scan line that should be used as the first source pixel which corresponds to the destination X1 coordinate.</p> <p>The monochrome source transparency mode indicates whether to use the source background color or de-assert the write enables when the bit in the source is 0. When the source bit is 1, then the source foreground color is used in the ROP operation. The ROP value chosen must involve source and no pattern data in the ROP operation. Negative Stride (= Pitch) is NOT ALLOWED.</p>

## XY\_FULL\_MONO\_PATTERN\_BLT

<b>XY_FULL_MONO_PATTERN_BLT</b>		
Project:	HSW	
Source:	BlitterCS	
Length Bias:	2	
<p>The full BLT is the most comprehensive BLT instruction. It provides the ability to specify all 3 operands: destination, source, and pattern. The pattern operand is monochrome and the source operand is the same bit width as the destination operand.</p> <p>The source and destination operands may overlap, which means that the X and Y directions can be either forward or backwards. The BLT Engine takes care of all situations. The base addresses plus the X and Y coordinates determine if there is an overlap between the source and destination operands. If the base addresses of the source and destination are the same and the Source X1 is less than Destination X1, then the BLT Engine performs the accesses in the X-backwards access pattern. There is no need to look for an actual overlap. If the base addresses are the same and Source Y1 is less than Destination Y1, then the scan line accesses start at Destination Y2 with the corresponding source scan line and the strides are subtracted for every scan line access.</p> <p>The monochrome pattern transparency mode indicates whether to use the pattern background color or de-assert the write enables when the bit in the source is 0. When the source bit is 1, then the pattern foreground color is used in the ROP operation.</p> <p>All scan lines and pixels that fall within the ClipRect Y and X coordinates are written. Only pixels within the ClipRectX coordinates and the Destination X coordinates are written using the raster operation.</p> <p>The Pattern Seeds correspond to Destination X = 0 (horizontal) and Y = 0 (vertical). The alignment is relative to the destination coordinates. The pixel of the pattern used / scan line is the (destination X coordinate + horizontal seed) modulo 8. The scan line of the pattern used is the (destination Y coordinate + vertical seed) modulo 8.</p> <p>Setting both Solid Pattern Select =1 and Mono Pattern Transparency = 1 is mutually exclusive. The device implementation results in NO PIXELS DRAWN.</p>

Source:	BlitterCS		
Length Bias:	2		
<p>This instruction allows the Driver to send monochrome data through the instruction stream, eliminating the read latency of the source during command execution.</p> <p>The IMMEDIATE_BLT data MUST transfer an even number of doublewords and the exact number of quadwords. DWL indicates the total number of Dwords of immediate data.</p> <p>All non-text monochrome sources are word aligned. At the end of a scan line of monochrome source, all bits until the next word boundary are ignored. The Monochrome source data bit position field [2:0] indicates the bit position within the first byte of the scan line that should be used as the first source pixel which corresponds to the destination X1 coordinate.</p> <p>The monochrome source transparency mode indicates whether to use the source background color or de-assert the write enables when the bit in the source is 0. When the source bit is 1, then the source foreground color is used in the ROP operation. The ROP value chosen must involve source and no pattern data in the ROP operation.</p> <p>The monochrome source data supplied corresponds to the Destination X1 and Y1 coordinates.</p> <p>Negative Stride (= Pitch) is NOT ALLOWED.</p>

## XY\_SRC\_COPY\_CHROMA\_BLT

XY_SRC_COPY_CHROMA_BLT	
Project:	HSW
Source:	BlitterCS
Length Bias:	2
<p>This BLT instruction performs a color source copy with chroma-keying where the only operands involved is a color source and destination of the same bit width.</p> <p>The source and destination operands may overlap, which means that the X and Y directions can be either forward or backwards. The BLT Engine takes care of all situations. The base addresses plus the X and Y coordinates determine if there is an overlap between the source and destination operands. If the base addresses of the source and destination are the same and the Source X1 is less than Destination X1, then the BLT Engine performs the accesses in the X-backwards access pattern. There is no need to look for an actual overlap. If the base addresses are the same and Source Y1 is less than Destination Y1, then the scan line accesses start at Destination Y2 with the corresponding source scan line and the strides are subtracted for every scan line access.</p> <p>The ROP value chosen must involve source and no pattern data in the ROP operation.</p>	
Programming Notes	Project
<p>This command should not be used if <b>all</b> of the following conditions are met. Either use alternative methods such as Scratch and temporary memory or break up the BLT commands to avoid this issue.</p> <ul style="list-style-type: none"><li>• Source Y1 == Destination Y1 - Explanation: Source and Destination start pixel Y coordinates (Source(Y1), Destination(Y1)) are same (that is Source and Destination planes are not vertically shifted to each other, but are aligned)</li><li>• Source X1 &gt; Destination X1 - Explanation: Destination start pixel X1, is at left (i.e. left shifted) from the Source start pixel X1. In other words, Source (X1) is &gt; Destination (X1)</li><li>• Source X1 Virtual Address[31:5] == Destination X1 Virtual Address[31:5] - Explanation: SRC X1 1/2 cacheline virtual address = DST X1 1/2 cacheline virtual address</li><li>• Destination X2 Virtual Address[31:5] != Destination X1 Virtual Address[31:5] - Explanation: DST X2 1/2 cacheline virtual address Not equal to DST X1 1/2 cacheline virtual address.</li></ul>	HSW

## XY\_SRC\_COPY\_CHROMA\_BLT

**Alternative Procedure for Driver:** The driver can work around this issue by separating blit operations into two separate blits. The driver can achieve this by:

2. Blit 1: Copy the source to another temporary surface which does not overlap with the source (by giving it a different Base Address)
3. Blit 2: Copy that temporary surface to the original destination surface which obviously will also not be overlapping.

## XY\_FULL\_IMMEDIATE\_PATTERN\_BLT

### XY\_FULL\_IMMEDIATE\_PATTERN\_BLT

Project: HSW  
 Source: BlitterCS  
 Length Bias: 2

The full BLT is the most comprehensive BLT instruction. It provides the ability to specify all 3 operands: destination, source, and pattern. The source and immediate pattern operands are the same bit width as the destination operand. The immediate data sizes are 64 bytes (16 DWs), 128 bytes (32 DWs), or 256 (64 DWs) for 8, 16, and 32 bpp color patterns. DWL indicates the total number of Dwords of immediate data.

The source and destination operands may overlap, which means that the X and Y directions can be either forward or backwards. The BLT Engine takes care of all situations. The base addresses plus the X and Y coordinates determine if there is an overlap between the source and destination operands. If the base addresses of the source and destination are the same and the Source X1 is less than Destination X1, then the BLT Engine performs the accesses in the X-backwards access pattern. There is no need to look for an actual overlap. If the base addresses are the same and Source Y1 is less than Destination Y1, then the scan line accesses start at Destination Y2 with the corresponding source scan line and the strides are subtracted for every scan line access.

All scan lines and pixels that fall within the ClipRect Y and X coordinates are written. Only pixels within the ClipRectX coordinates and the Destination X coordinates are written using the raster operation.

The Pattern Seeds correspond to Destination X = 0 (horizontal) and Y = 0 (vertical). The alignment is relative to the destination coordinates. The pixel of the pattern used / scan line is the (destination X coordinate + horizontal seed) modulo 8. The scan line of the pattern used is the (destination Y coordinate + vertical seed) modulo 8.

## STATE\_PREFETCH

STATE_PREFETCH			
Project:	HSW		
Source:	BSpec		
Length Bias:	2		
<p>(This command is provided strictly for performance optimization opportunities, and likely requires some experimentation to evaluate the overall impact of additional prefetching.)</p> <p>The STATE_PREFETCH command causes the GPE to attempt to prefetch a sequence of 64-byte cache lines into the GPE-internal cache ("L2 ISC") used to access EU kernel instructions and fixed/shared function indirect state data. While state descriptors, surface state, and sampler state are automatically prefetched by the GPE, this command may be used to prefetch data not automatically prefetched, such as: 3D viewport state; Media pipeline Interface Descriptors; EU kernel instructions.</p>			
<b>Restriction</b>

## PIPELINE\_SELECT

<b>PIPELINE_SELECT</b>	
Project:	HSW
Source:	BSpec
Length Bias:	1
Description	Project
The PIPELINE_SELECT command is used to specify which GPE pipeline is to be considered the 'current' active pipeline. Issuing 3D-pipeline-specific commands when the Media pipeline is selected, or vice versa, is UNDEFINED.	
Issuing 3D-pipeline-specific commands when the GPGPU pipeline is selected, or vice versa, is UNDEFINED.	HSW
Programming common non pipeline commands (e.g., STATE_BASE_ADDRESS) is allowed in all pipeline modes.	
Programming Notes	Project
Software must ensure all the write caches are flushed through a stalling PIPE_CONTROL command followed by another PIPE_CONTROL command to invalidate read only caches prior to programming MI_PIPELINE_SELECT command to change the Pipeline Select Mode. Example: ... Workload-3Dmode PIPE_CONTROL (CS Stall, Depth Cache Flush Enable, Render Target Cache Flush Enable, DC Flush Enable) PIPE_CONTROL (Constant Cache Invalidate, Texture Cache Invalidate, Instruction Cache Invalidate, State Cache invalidate) PIPELINE_SELECT ( GPGPU)	HSW
Hardware Binding Tables are only supported for 3D workloads. Resource streamer must be enabled only for 3D workloads. Resource streamer must be disabled for Media and GPGPU workloads. Batch buffer containing both 3D and GPGPU workloads must take care of disabling and enabling Resource Streamer appropriately while changing the PIPELINE_SELECT mode from 3D to GPGPU and vice versa. Resource streamer must be disabled using MI_RS_CONTROL command and Hardware Binding Tables must be disabled by programming 3DSTATE_BINDING_TABLE_POOL_ALLOC with "Binding Table Pool Enable" set to disable (i.e. value '0'). Example below shows disabling and enabling of resource streamer in a batch buffer for 3D and GPGPU workloads. MI_BATCH_BUFFER_START (Resource Streamer Enabled) PIPELINE_SELECT (3D) 3DSTATE_BINDING_TABLE_POOL_ALLOC (Binding Table Pool Enabled) 3D WORKLAOD MI_RS_CONTROL (Disable Resource Streamer) 3DSTATE_BINDING_TABLE_POOL_ALLOC (Binding Table Pool Disabled) PIPELINE_SELECT (GPGPU) GPGPU Workload	HSW

## PIPELINE\_SELECT

3DSTATE_BINDING_TABLE_POOL_ALLOC (Binding Table Pool Enabled) MI_RS_CONTROL (Enable Resource Streamer) 3D WORKLOAD MI_BATCH_BUFFER_END	
---	--

Note:	Project
<b>Note:</b> Software must send a pipe_control with a CS stall and a post sync operation and then a dummy DRAW after every MI_SET_CONTEXT and after any PIPELINE_SELECT that is enabling 3D mode. A dummy draw is a 3DPRIMITIVE command with Indirect Parameter Enable set to 0, UAV Coherency Required set to 0, Predicate Enable set to 0, End Offset Enable set to 0, and Vertex Count Per Instance set to 0. All other parameters are a don't care.	DevHSW:GT3:A0

		<b>Value</b>	<b>Name</b>	<b>Description</b>	
		1	Long Format Driver Interface	[ HSW, EXCLUDE(HSW:GT3:A, HSW:GT3:B, HSW:GT2:B)] AVC/VC1/MVC/SVC Long Format Mode is in use.	
		0	Short Format Driver Interface <b>[Default]</b>	AVC/VC1/MVC/SVC/VP8 Short Format Mode is in use <b>Note: There is no Short Format for SVC and VP8 yet, so this field must be set to 1 for SVC and VP8.</b>	
16:15	<b>Decoder Mode select</b>				
Each coding standard supports two entry points: VLD entry point and IT (IDCT) entry point. This field selects which one is in use. This field is only valid if Codec Select is 0 (decoder).					
		<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>
		0h	VLD Mode	All codec minimum must support this mode Configure the MFD Engine for VLD Mode Note: All codec minimum must support this mode	

## MFX\_PIPE\_MODE\_SELECT

	1h	IT Mode	Configure the MFD Engine for IT Mode Note: Only VC1 and MPEG2 support this mode	
	2h	Deblocker Mode	Configure the MFD Engine for Standalone Deblocker Mode. Require streamout AVC edge control information from preceeding decoding pass. Note: [HSW, EXCLUDE(HSW:GT3:A, HSW:GT3:B, HSW:GT2:B)] Only AVC, MPEG2 and SVC are supported.	HSW+
	3h	Interlayer Mode	Configure the MFX Engine for standalone SVC interlayer upsampling for motion info, residual and reconstructed pixel. Require information being streamout from the preceding encoding and decoding pass of a reference layer.>	HSW, EXCLUDE(HSW:GT3:A, HSW:GT3:B, HSW:GT2:B)
14:13	<b>Reserved</b>			
	Project:		HSW	
	Format:		MBZ	
12	<b>Deblocker Stream-Out Enable</b>			
	Project:		HSW+	
	<p>This field indicates if Deblocker information is going to be streamout during VLD decoding. For AVC, it is needed to enable the deblocker streamout as the AVC Disable_DLKFilterIdc is a slice level parameters. Driver needs to determine ahead of time if at least one slice of the current frame/ has deblocker ON.</p> <p>For SVC, there are two deblocking control streamout buffers (specified in MFX_BUF_ADDR State Command). This field is still associated with the slice level SVC Disable.DLK_Filter_Idc.</p>			
	<b>Value</b>	<b>Name</b>	<b>Description</b>	
	0h	Disable	Disable streamout of deblocking control information for standalone deblocker operation. It needs other fields to determine one or two SVC deblocking surface streamout (Post Deblocking Output Enable, Pre Deblocking Output Enable, interlayer idc and regular deblock idc).	
	1h	Enable		
11	<b>Pic Error/Status Report Enable.</b>			
	Project:		HSW	
	<p>This field control whether the error/status reporting is enable or not.0: Disable1: EnableIn decoder modes: Error reporting is written out once per frame. The Error Report frame ID listed in DW3 along with the VLD/IT error status bits are packed into one cache and written to the "Decoded Picture Error/Status Buffer address" listed in the MFX_PIPE_BUF_ADDR_STATE Command. Note: driver shall program different error buffer addresses between pictrue; otherwise, hardware might overwrite previous written data if driver does not read it fast enough.In encoder modes: Not used</p>			

## MFX\_PIPE\_MODE\_SELECT

		Value	Name
		0h	Disable
		1h	Enable
10	<b>Stream-Out Enable</b> This field controls whether the macroblock parameter stream-out is enabled during VLD decoding for transcoding purpose.		
		Value	Name
		0h	Disable
		1h	Enable
	<b>Programming Notes</b>		
	In decoder modes: The Stream-Out feature is added to support transcoding. While decoding the input compressed stream, selected decoded information may be used by the encoder for re-compression. In encoder modes: This feature used to perform dynamic Multipass of PAK for conformance pupose. Also it provides feedback to host (ENC) for future needs. Software can use this bit to disable writing PAK steam data to the streamout buffer for last pass of frame in PAK. Thus, save memory bandwidth.		
9	<b>Post Deblocking Output Enable (PostDeblockOutEnable)</b> This field controls the output write for the reconstructed pixels AFTER the deblocking filter. In MPEG2 decoding mode, if this is enabled, VC1 deblocking filter is used.		
		Value	Name
		0h	Disable

		[0,FFFFFFFFh]					
		Programming Notes	Project				
		<p>Driver must invalidate the vertex fetch cache thru the <b>VF(address based) Cache Invalidation Enable</b> thru a PIPE_CONTROL command prior to reusing the same graphics memory space.</p> <p>VF cache invalidation must be done when any graphics memory space is reused within the same 64-byte cacheline.</p>	HSW				

## MFX\_SURFACE\_STATE

### MFX\_SURFACE\_STATE

Project: HSW  
Source: VideoCS  
Length Bias: 2

This command is common for all encoding/decoding modes, to specify the uncompressed YUV picture (i.e. destination surface) or intermediate streamout in/out surface (e.g. coefficient/residual) (field, frame or interleaved frame) format for reading and writing:

- Uncompressed, original input picture to be encoded
- Reconstructed non-filtered/filtered display picture (becoming reference pictures as well for subsequent temporal inter-prediction)
- Residual in SVC
- Reconstructed Intra pixel in SVC
- CoeffPred in SVC

Since there is only one media surface state being active during the entire encoding/decoding process, all the uncompressed/reconstructed pictures are defined to have the same surface state. For each media object call (decoding or encoding), multiple SVC surfaces can be active concurrently, to distinguish among them, a surfaceID is added to specify for each type of surface. The primary difference among picture surface states is their individual programmed base addresses, which are provided by other state commands and not included in this command. MFX engine is making the association of surface states and corresponding buffer base addresses. MFX engine currently supports only one media surface type for video and that is the NV12 (Planar YUV420 with interleaved U (Cb) and V (Cr)). For optimizing memory efficiency based on access patterns, only TileY is supported. For JPEG decoder, only IMC1 and IMC3 are supported. Pitch can be wider than the Picture Width in pixels and garbage will be there at the end of each line. The following describes all the different formats that are supported and not supported in Gen7 MFX :

- NV12 - 4:2:0 only; UV interleaved; Full Pitch, U and V offset is set to 0 (the only format supported for video codec); vertical UV offset is MB aligned; UV xoffsets = 0. JPEG does not support NV12 format because non-interleave JPEG has performance issue with partial write (in interleaved UV format)
- IMC 1 & 3 - Full Pitch, U and V are separate plane; (JPEG only; U plane + garbage first in full pitch followed by V plane + garbage in full pitch). U and V vertical offsets are block aligned; U and V xoffset = 0; there is no gap between Y, U and V planes. IMC1 and IMC3 are different by a swap of U and V. This is the only format supported in JPEG for all video subsampling types (4:4:4, 4:2:2 and 4:2:0)
- We are not supporting IMC 2 & 4 - Full Pitch, U and V are separate plane (JPEG only; U plane first in full pitch followed by V plane in full pitch - U and V plane are side-by-side). U and V vertical offsets are 16-pixel aligned; V xoffset is half-pitch aligned; U xoffset is 0; there is no gap between Y, U and V planes. IMC2 and IMC4 are different by a swap of U and V.
- We are not supporting YV12 - half pitch for each U and V plane, and separate planes for Y, U and V (U plane first in half pitch followed by V plane in half pitch). For YV12, U and V vertical offsets are block aligned; U and V xoffset = 0; there is no gap between Y, U and V planes

## MFX\_SURFACE\_STATE

Note that the following data structures are not specified through the media surface state

- 1D buffers for row-store and other miscellaneous information.
- 2D buffers for per-MB data-structures (e.g. DMV biffer, MB info record, ILDB Control and Tcoeff/Stocoeff).

This surface state here is identical to the Surface State for deinterlace and sample\_8x8 messages described in the Shared Function Volume and Sampler Chapter.

For non pixel data, such as row stores, indirect data (Compressed Slice Data, AVC MV record, Coeff record and AVC ILDB record) and streamin/out and output compressed bitstream, a linear buffer is employed. For row stores, the H/W is designed to guarantee legal memory accesses (read and write). For the remaining cases, indirect object base address, indirect object address upper bound, object data start address (offset) and object data length are used to fully specified their corresponding buffer. This mechanism is chosen over the pixel surface type because of their variable record sizes.

All row store surfaces are linear surface. Their addresses are programmed in Pipe\_Buf\_Base\_State or Bsp\_Buf\_Base\_Addr\_State

### Programming Notes

VC1 I picture scaling: Even though VC1 allows I reconstructed picture scaling (via RESPIC), as such scaling is only allowed at I picture. All subsequent P (and B) pictures must have the same picture dimensions with the preceding I picture. Therefore, all reference pictures for P or B picture can share the same surface state with the current P and B picture. Note : H/W is not processing RESPIC. Application is no longer expecting intel decoder pipelineand kernel to perform this function, it is going to be done in the video post-processing scaler or display controller scale as a separate step and controller.

All video codec surfaces must be NV12 Compliant, except JPEG. U/V vertical must be MB aligned for all video codec (further contrained for field picture), but JPEG can be block aligned. All video codec and JPEG uses Tiled - Y format only, for uncompressed pixel surfaces.

Even for JPEG planar 420 surface, application may provide only 1 buffers, but there is still only one single surface state for all of them. If IMC equal to 1, 2, 3 or 4, U and V have the pitch same as Y. And U and V will have different offset, each offset is block aligned.

3	31:28	<b>Surface Format</b>								

## MFX\_SURFACE\_STATE

Specifies the format of the surface. All of the Y and G channels will use table 0 and all of the Cr/Cb/R/B channels will use table 1. Usage: For 420 planar YUV surface, use 4; for monochrome surfaces, use 12. For monochrome surfaces, hardware ignores control fields for Chroma planes. This field must be set to 4 - PLANAR\_420\_8, or 12 - Y8\_UNORM. Not used for MFX, and is ignored. But for JPEG decoding, this field should be programmed to the same format as JPEG\_PIC\_STATE. For video codec, it should set to 4 always.

Value	Name	Description
0	YCRCB_NORMAL	
1	YCRCB_SWAPUVY	
2	YCRCB_SWAPUV	
3	YCRCB_SWAPY	
4	PLANAR_420_8	(NV12, IMC1,2,3,4, YV12)
5	PLANAR_411_8	Deinterlace Only
6	PLANAR_422_8	Deinterlace Only
7	STMM_DN_STATISTICS	Deinterlace Only

9	R8G8B8A8_UNORM	Sample_8x8 Only
10	R8B8_UNORM (CrCb)	Sample_8x8 Only
11	R8_UNORM (Cr/Cb)	Sample_8x8 Only
12	Y8_UNORM	Sample_8x8 Only
13,15	Reserved	

### 27 Interleave Chroma

Format:	Enable
---------	--------

This field indicates that the chroma fields are interleaved in a single plane rather than stored as two separate planes. This field is only used for PLANAR surface formats. For AVC/VC1/MPEG VLD and IT modes : set to Enable to support interleave U/V only. For JPEG : set to Disable for all formats (including 4:2:0) - because JPEG does not support NV12. (This field is needed only if JPEG will support NV12; otherwise is ignored.)

Value	Name
1	Enable
0	Disable

### 26 Reserved

Format:	MBZ
---------	-----

### 25:22 Surface Object Control State (MEMORY\_OBJECT\_CONTROL\_STATE)

Project:	HSW
----------	-----

Memory object control state provides a lighter control over the memory interface caches compared to PTE settings. However MOCS (Memory Object Control State) is the only way to manage L3\$ caching for a given surface.

## MFX\_SURFACE\_STATE

		For the latest definition of these 4 bits, please refer to <b>Memory Object Control State (MOCS)</b> section, under <i>Vol1c Memory Interface and Command Stream</i> .	
	21:20	<b>Reserved</b>	
		Project:	HSW
		Format:	MBZ
	19:3	<b>Surface Pitch</b>	
		Format:	U17-1 pitch in Bytes
		This field specifies the surface pitch in (#Bytes).	
		<b>Value</b>	<b>Name</b>
		[0,2047]	to [1B, 2048B]
		<b>Programming Notes</b>	
		For tiled surfaces, the pitch must be a multiple of the tile width (i.e.128 bytes aligned). If Half Pitch for Chroma is set, this field must be a multiple of two tile widths for tiled surfaces, or a multiple of 2 bytes for linear surfaces.For Y-tiled surfaces: Range = [127, 524287] to [128B,256KB] = [1 tile, 2048 tiles]	
		For Each SVC SurfaceID: 00b: 8-bit uncompressed pixel or coeff_pred data - pitch >= upper layer pic width aligned to 128-byte tile. 01b: 16-bit uncompressed residual data - pitch >= 2*upper layer pic width aligned to 128-byte tile. 10b: 8-bit uncompressed pixel or coeff_pred data - pitch >= lower layer pic width aligned to 128-byte tile. 11b: 16-bit uncompressed residual data - pitch >= 2*lower layer pic width aligned to 128-byte tile.	
	2	<b>Half Pitch for Chroma</b>	
		Format:	Enable
		(This field must be set to Disable)This field indicates that the chroma plane(s) will use a pitch equal to half the value specified in the Surface Pitch field. This field is only used for PLANAR surface formats.This field is ignored by MFX (unless we support YV12)	
	1	<b>Tiled Surface</b>	
		Format:	Boolean
		(This field must be set to TRUE: Tiled)This field specifies whether the surface is tiled.This field is ignored by MFX	
		<b>Value</b>	<b>Name</b>
		0	False
		1	True

## MFX\_SURFACE\_STATE

MFX_SURFACE_STATE													
		<b>Programming Notes</b>											
		Linear surfaces can be mapped to Main Memory (uncached) or System Memory (cacheable, snooped). Tiled surfaces can only be mapped to Main Memory. The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this bit.											
	0	<b>Tile Walk</b> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%;">Format:</td> <td style="width: 50%;">3D_Tilewalk</td> </tr> </table> <p>(This field must be set to 1: TILEWALK_YMAJOR) This field specifies the type of memory tiling (XMajor or YMajor) employed to tile this surface. See Memory Interface Functions for details on memory tiling and restrictions. This field is ignored when the surface is linear. This field is ignored by MFX. Internally H/W is always treated this set to 1 for all video codec and for JPEG.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 20%;">Value</th> <th style="width: 30%;">Name</th> <th style="width: 50%;">Description</th> </tr> </thead> <tbody> <tr> <td>0h</td> <td>XMAJOR</td> <td>TILEWALK_XMAJOR</td> </tr> <tr> <td>1h</td> <td>YMAJOR</td> <td>TILEWALK_YMAJOR</td> </tr> </tbody> </table> <div style="text-align: center; background-color: #e0e0e0; padding: 5px;"><b>Programming Notes</b></div> <p>The corresponding cache(s) must be invalidated before a previously accessed surface is accessed again with an altered state of this bit</p>	Format:	3D_Tilewalk	Value	Name	Description	0h	XMAJOR	TILEWALK_XMAJOR	1h	YMAJOR	TILEWALK_YMAJOR

		Format: U17 In bytes				
<p>This field provides the length in bytes of the Interface Descriptor data. This field must have the same alignment as the Interface Descriptor Data Start Address. It must be DQWord (32-byte) aligned. As the Interface Descriptor data are sent directly to ROB, range is limited to CURBE Allocation Size.</p>						

## MEDIA\_INTERFACE\_DESCRIPTOR\_LOAD

		Value	Name	Project
		[32,2048]	[1,64] interface descriptor entries	DevHSW+
		Restriction		Project
		Restriction : Interface Descriptors are limited to [1,32] when Context Switch is enabled.		HSW
3	31:0	<b>Interface Descriptor Data Start Address</b>		
		Format:	DynamicStateOffset[31:0]INTERFACE_DESCRIPTOR_DATA	
		Description		Project
		This bit specifies the <u>32-byte</u> aligned address of the Interface Descriptor data. This pointer is relative to the Dynamics Base Address.		HSW
		Value	Name	
		[0,FFFFFFFFh]		
		Programming Notes		Project
		Driver must invalidate the vertex fetch cache thru the <b>VF(address based) Cache Invalidation Enable</b> thru a PIPE_CONTROL command prior to reusing the same graphics memory space. VF cache invalidation must be done when any graphics memory space is reused within the same 64-byte cacheline.		HSW

## MFX\_PIPE\_BUF\_ADDR\_STATE

MFX_PIPE_BUF_ADDR_STATE			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>This state command provides the memory base addresses for all row stores, StreamOut buffer and reconstructed picture output buffers required by the MFD or MFC Engine (that are in addition to the row stores of the Bit Stream Decoding/Encoding Unit (BSD/BSE) and the reference picture buffers). This is a picture level state command and is common among all codec standards and for both encoder and decoder operating modes. However, some fields may only applicable to a specific codec standard. All Pixel Surfaces (original, reference frame and reconstructed frame) in the Encoder are programmed with the same surface state (NV12 and TileY format), except each has its own frame buffer base address. In the tile format, there is no need to provide buffer offset for each slice; since from each MB address, the hardware can calculated the corresponding memory location within the frame buffer directly.</p>

## **MFX\_PIPE\_BUF\_ADDR\_STATE**

		Specifies the memory object control state for this surface.
--	--	---

## MFX\_IND\_OBJ\_BASE\_ADDR\_STATE

<b>MFX_IND_OBJ_BASE_ADDR_STATE</b>		
Project:	HSW	
Source:	VideoCS	
Length Bias:	2	
<p>This state command provides the memory base addresses for all row stores, StreamOut buffer and reconstructed picture output buffers required by the MFD or MFC Engine (that are in addition to the row stores of the Bit Stream Decoding/Encoding Unit (BSD/BSE) and the reference picture buffers). This is a picture level state command and is common among all codec standards and for both encoder and decoder operating modes. However, some fields may only applicable to a specific codec standard. All Pixel Surfaces (original, reference frame and reconstructed frame) in the Encoder are programmed with the same surface state (NV12 and TileY format), except each has its own frame buffer base address. In the tile format, there is no need to provide buffer offset for each slice; since from each MB address, the hardware can calculated the corresponding memory location within the frame buffer directly.</p>		
<p>The MFX_IND_OBJ_BASE_ADDR command sets the memory base address pointers for the corresponding Indirect Object Data Start Addresses (Offsets) specified in each OBJECT commands. The characteristic of these indirect object data is their variable size (per MB or per Slice). Hence, each OBJECT command must specify the indirect object data offset from the base address to start fetching or writing object data.</p>		
<p>While the use of base address is unconditional, the indirection can be effectively disabled by setting the base address to zero. For decoder, there are only 1 read-only per-slice indirect object in the BSD_OBJECT Command, and 2 read-only per-MB indirect objects in the IT_OBJECT CommandFor decoder: the Video Command Streamer (VCS) will perform the memory access bound check automatically using the corresponding MFC Indirect Object Access Upper Bound specification. If any access is at or beyond the upper bound, zero value is returned. The request to memory is still being sent, but the corresponding codec's BSD unit will detect this condition and perform the zeroing return. If the Upper Bound is turned off, the beyond bound request will return whatever on the bus (invalid data).For encoder, there are 1 read-only per-MB indirect object in the PAK_OBJECT Command, and 1 write-only per-slice indirect object in the PAK Slice_State CommandFor encoder: whenever an out of bound address accessing request is generated, VMX will detect such requests and snap the address to the corresponding [indirect object base address + indirect data start address]. VMX will return all 0s as the data to the requester. NotationDefinitionPhysicalAddress[n:m] Corresponding bits of a physical graphics memory byte address (not mapped by a GTT)GraphicsAddress[n:m] Corresponding bits of an absolute, virtual graphics memory byte address (mapped by a GTT).</p>

## MEDIA\_STATE\_FLUSH

<b>MEDIA_STATE_FLUSH</b>			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
<p>This command updates the Message Gateway state. In particular, it updates the state for a selected Interface Descriptor.</p> <p>This command can be considered same as a MI_Flush except that only media parser will get flushed instead of the entire 3D/media render pipeline. The command should be programmed prior to new Media state, curbe and/or interface descriptor commands when switching to a new context or programming new state for the same context.</p> <p>With this command, pipelined state change is allowed for the media pipe.</p> <p>It should be cautious when using this command when child_present flag in the media state is enabled. This is because that CURBE state as well as Interface Descriptor state are shared between root threads and child threads. Changing these states while child threads are generated on the fly may cause unexpected behavior.</p> <p>Combining with MI_ARB_ON/OFF command, it is possible to support interruptability with the following command sequence where interrupt may be allowed only when MI_ARB_ON_OFF is ON:</p> <p>MEDIA_STATE_FLUSH            VFE_STATE // VFE will hold CS if watermark isn't met            MI_ARB_OFF // There must be at least one VFE command before this one            MEDIA_OBJECT .... MI_ARB_ON</p>

## MFX\_BSP\_BUF\_BASE\_ADDR\_STATE

MFX_BSP_BUF_BASE_ADDR_STATE			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>This frame-level state command is used to specify all the buffer base addresses needed for the operation of the AVC Bit Stream Processing Units (for decoder, it is BSD Unit; for encoder, it is BSE Unit)For both encoder and decoder, currently it is assumed that all codec standards can share the same BSP_BUF_BASE_STATE. The simplicity of this command is the result of moving all the direct MV related processing into the ENC Subsystem. Since all implicit weight calculations and directMV calculations are done in ENC and all picture buffer management are done in the Host, there is no need to provide POC (POC List - FieldOrderCntList, CurrPic POC - CurrFieldOrderCnt) information to PAK. For decoder, all the direct mode information are sent in a separate slice-level command (AVC_DIRECTMODE_STATE command).In addition, in Encoder, the row stores for CABAC encoding and MB Parameters Construction (MPC) are combined into one single row store.The row stores specified in this command do not combine with those specified in the MFC_PIPE_BUF_ADDR_STATE command for hardware simplification reason.</p>

## MFX\_STATE\_POINTER

MFX_STATE_POINTER			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>The MFX_STATE_POINTER command, issued at picture level, is used to set up the indirect pointers for VCS to fetch all the MFX states (Image state, Slice state, etc.) needed for the encoding/decoding process in PAK/IT mode. The encoding/decoding states are presented by state commands, which are grouped into separate sets (picture level, slice level, etc.), and each is stored in its own memory buffer referred by an indirect state pointer. The content of each indirect state buffer is a list of MFX state commands with no special format requirements. The sequence of commands in each indirect state buffer is terminated by a MI_BATCH_BUFFER_END command (acts as the last command marker). Therefore, indirect state buffers can have different and variable length of command sequences.</p> <p>The indirection is designed to facilitate context switching in the middle of a codec operation. The smallest granularity of interruption is designed to be at a completed MB row in AVC/VC1/MPEG2 IT and AVC PAK operating modes as well as in VC1/MPEG2 VLD mode. There is no support for context switch in AVC VLD mode. Hardware supports up to 4 separate indirect state pointers, allowing software to manage the grouping of state commands. During context switch, hardware restores (re-issues) the latest version of each indirect state pointer, if present.</p> <p>MFX_STATE_POINTER command can only program one indirect state pointer at a time. MI_FLUSH will invalidate all indirect state buffer pointers inside VCS.</p>

## MFX\_QM\_STATE

<b>MFX_QM_STATE</b>			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>This is a common state command for AVC encoder modes. For encoder, it represents both the forward QM matrices as well as the decoding QM matrices. This is a Frame-level state. Only Scaling Lists specified by an application are being sent to the hardware. The driver is responsible for determining the final set of scaling lists to be used for decoding the current slice, based on the AVC Spec Table 7-2 (Fall-Back Rules A and B). In MFX AVC PAK mode, PAK needs both forward Q scaling lists and IQ scaling lists. The IQ scaling lists are sent as in MFD in raster scan order. But the Forward Q scaling lists are sent in column-wise raster order (column-by-column) to simplify the H/W. Driver will perform all the scan order conversion for both ForwardQ and IQ.</p>

## MFX\_PAK\_INSERT\_OBJECT

<b>MFX_PAK_INSERT_OBJECT</b>	
Project:	HSW
Source:	VideoCS
Length Bias:	2
Description	Project
The MFX_PAK_INSERT_OBJECT command is the first primitive command for the AVC and MPEG2 Encoding Pipeline.	HSW
The MFX_PAK_INSERT_OBJECT command is the first primitive command for the AVC, MPEG2 and SVC Encoding Pipeline.	DevHSW, EXCLUDE(DevHSW:GT3:A, DevHSW:GT3:B, DevHSW:GT2:B)
<p>This command is issued to setup the control and parameters of inserting a chunk of compressed/encoded bits into the current bitstream output buffer starting at the specified bit location to perform the actual insertion by transferring the command inline data to the output buffer max, 32 bits at a time.</p> <p>It is a variable length command as the data to be inserted are presented as inline data of this command. It is a multiple of 32-bit (1 DW), as the data bus to the bitstream buffer is 32-bit wide.</p> <p>Multiple insertion commands can be issued back to back in a series. It is host software's responsibility to make sure their corresponding data will properly stitch together to form a valid H.264 bitstream.</p> <p>Internally, MFX hardware will keep track of the very last two bytes' (the very last byte can be a partial byte) values of the previous insertion. It is required that the next Insertion Object Command or the next PAK Object Command to perform the start code emulation sequence check and prevention 0x03 byte insertion with this end condition of the previous insertion.</p> <p>Hardware will keep track of an output bitstream buffer current byte position and the associated next bit insertion position index. Data to be inserted can be a valid H.264 NAL units or a partial NAL unit. Certain NAL unit has a minimum byte size requirement. As such the hardware will optionally (enabled by STATE Command) determines the number of CABAC_ZERO_WORD to be inserted to the end of the current NAL, based on the minimum byte size of a NAL and the actual bin count of the encoded Slice. Since prior to the CABAC_ZERO_WORD insertion, the RBSP or EBSP is already byte-aligned, so each CABAC_ZERO_WORD insertion is actually a 3-byte sequence 0x00 00 03. The inline data may have already been processed for start code emulation byte insertion, except the possibility of the last 2 bytes plus the very last partial byte (if any). Hence, when hardware performing the concatenation of multiple consecutive insertion commands, or concatenation of an insertion command and a PAK object command, it</p>	

## MFX\_PAK\_INSERT\_OBJECT

must check and perform the necessary start code emulation byte insert at the junction. The inline data is required to be byte aligned on the left (first transmitted bit order) and may or may not be byte aligned on the right (last transmitted bits).

The command will specify the bit offset of the last valid DW. Each insertion state command defines a chunk of bits (compressed data) to be inserted at a specific location of the output compressed bitstream in the output buffer. Depend on CABAC or CAVLC encoding mode (from Slice State), PAK Object Command is always ended in byte aligned output bitstream except for CABAC header insertion which is bit aligned. In the aligned cases, PAK will perform 0 filling in CAVLC mode, and 1 filling in CABAC mode.

Insertion data can include: any encoded syntax elements bit data before the encoded Slice Data (PAK Object Command) of the current SliceSPS NALPPS NALSEI NALOther Non-Slice NALLeading\_Zero\_8\_bits (as many bytes as there is) Start Code PrefixNAL Header ByteSlice HeaderAny encoded syntax elements bit data after the encoded Slice Data (PAK Object Command) of the current Slice and prior to the next encoded Slice Data of the next Slice or prior to the end of the bistream, whichever comes firstCabac\_Zero\_Word or Trailing\_Zero\_8bits (as many bytes as there is).

Anything listed above before a Slice DataContext switch interrupt is not supported by this command.

DWord	Bit	Description		
0	31:29	<b>Command Type</b>		
		Default Value:	3h PARALLEL_VIDEO_PIPE	
		Format:	OpCode	
	28:27		<b>Pipeline</b>	
			Default Value:	2h MFX_PAK_INSERT_OBJECT
			Format:	OpCode
	26:24		<b>Media Command Opcode</b>	
			Default Value:	0h MFX_COMMON
			Format:	OpCode
	23:21		<b>SubOpcode A</b>	
			Default Value:	2h
			Format:	OpCode
20:16		<b>SubOpcode B</b>		
		Default Value:	8h	
		Format:	OpCode	
15:12		<b>Reserved</b>		
		Format:	MBZ	

## MFX\_PAK\_INSERT\_OBJECT

	11:0	<b>DWord Length</b>		
		Default Value:	0h Excludes DWord (0,1) = Variable Length in DW	
		Format:	=n Total Length - 2	
1	31:18	<b>Reserved</b>		
		Format:	MBZ	
	17:16	<b>DataByteOffset - SrcDataStartingByteOffset[1:0]</b>	Source Data Starting Byte Position within the very first inline DW.	
	15	<b>HeaderLengthExcludeFrmSize</b>	<p>In case this flag is on, bits are NOT accumulated during current access unit coding neither for Cabac Zero Word insertion bits counting or for output in MMIO register MFC_BITSTREAM_BYTECOUNT_FRAME_NO_HEADER.</p> <p>When using HeaderLengthExcludeFrmSize for header insertion, the software needs to make sure that data comes already with inserted start code emulation bytes. SW shouldn't set EmulationFlag bit ( Bit 3 of DWORD1 of MFX_PAK_INSERT_OBJECT).</p>	
		<b>Value</b>	<b>Name</b>	<b>Description</b>
		1	NO_ACCUMULATION	Bits during current call are not accumulated
		0	ACCUMULATE	All bits accumulated
	14	<b>Slice Header Indicator</b>	<p>This bit indicates if the insert object is a slice header. In the VDEnc mode, PAK only gets this command at the beginning of the frame for slice position X=0, Y=0. It internally generates the header that needs to be inserted per slice. For VDEnc mode, this bit should always be set.</p>	
		<b>Value</b>	<b>Name</b>	<b>Description</b>
		1	SLICE_HEADER	Insertion Object is a Slice Header. The command is stored internally by HW and is used for inserting slice headers.
		0	LEGACY	Legacy Insertion Object command. The PAK Insertion Object command is not stored in HW.
		<b>Programming Notes</b>		
		<p>In VDENC mode, we support only Slice layer without partitioning RBSP syntax.            The payload for PAK_INS_OBJ should contain only start code for Slice header followed by NAL_type and slice header (slice_header() in AVC spec).            The payload for PAK_INS_OBJ shouldn't contain CABAC Byte alignment bits. HW adds these alignment bits which are part of slice_data.            Example PAK_INS_OBJ payload : 00 00 01 &lt;NAL_type&gt; &lt;slice_header_Byte0&gt;            .....&lt;slice_header_Byte LAST&gt;            Any zero_bytes that are added before slice header can be inserted by any preceding general PAK_INS_OBJ.</p>		
	13:8	<b>DataBitsInLastDW - SrCDDataEndingBitInclusion[5:0]</b>	Source Data to be included in the very last inline DW. Follows the MSBit is the upper bit of each byte within the DW. The lower byte is actually processed first.For example, SrCDDataEndingBitInclusion = 9, bit 7:0 and bit 15 are included as valid header data.	

## MFX\_PAK\_INSERT\_OBJECT

		Value	Name
		[1,32]	
7:4	<b>SkipEmulByteCnt - Skip Emulation Byte Count</b> Skip emulation check for number of starting bytesIt can be programmed from 0 to 15 bytes.For example, to skip the start code that has already prefixed in the bitstream.		
3	<b>EmulationFlag - EmulationByteBitsInsertEnable</b>		
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	0	NONE	No emulation
	1	EMULATE	Instruct the hardware to perform Start Code Prefix (0x 00 00 01/02/03/00) Search and Prevention Byte (0x 03) insertion on the insertion data of this command. It is required that hardware will handle a start code prefix crossing the boundary between insertion commands, or an insertion command followed by a PAK Object command.
2	<b>LastHeaderFlag - LastSrcHeaderDataInsertCommandFlag</b> To process a series of consecutive insertion commands, this flag (=1) indicates the current command is the last 'header' insertion in the series.In CABAC, hardware must perform the "1" insert for byte align for Slice Header before Slice Data comes in in the next PAK-OBJECT command.In CAVLC, hardware ignores this bit		
1	<b>EndOfSliceFlag - LastDstDataInsertCommandFlag</b> No more insertion command and no more PAK-OBJECT command follows.Flush data out to memory		
0	<b>BitstreamStartReset - ResetBitStreamStartingPos</b>		
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	1	RESET	Reset the bitstream buffer insertion position to the bitstream buffer starting position.
	0	INSERT	Insert the current command inline data starting at the current bitstream buffer insertion position
2..n	31:0	<b>Insert Data Payload</b> Actual Data to be inserted to the output bitstream buffer.	

## MFX\_STITCH\_OBJECT

<b>MFX_STITCH_OBJECT</b>		
Project:	HSW	
Source:	VideoCS	
Length Bias:	2	
<p>The MFC_STITCH_OBJECT command is used when stitch-enabled is set to 1, while CodecSel and StandardSel are set to ENCODE and AVC, respectively. This command is used, for example, to stitch multiple bitstreams to form a transport stream.</p> <p>It is a variable length command as the data to be inserted are presented as either inline data and/or indirect data of this command. Multiple insertion commands can be issued back to back in a series. It is host software's responsibility to make sure their corresponding data will properly stitch together to form a valid output. Hardware keeps track of an output bitstream buffer current byte position and the associated next bit insertion position index. Context switch interrupt is not supported by this command.</p>

This field is AND'd with the corresponding Scoreboard Mask field in the MEDIA_VFE_STATE command.</p> <p><b>Bit n (for n = 0...7):</b> Scoreboard n is dependent, where bit 0 maps to n = 0.</p>
6..n	31:0	<p><b>Inline Data</b></p> <p>Generic Mode: The format of this data is specified by software. Hardware does not interpret this data; it merely passes it to the kernel for processing. The total size for the inline data and indirect data must not exceed 112 registers.</p>

## MFX\_AVC\_IMG\_STATE

<b>MFX_AVC_IMG_STATE</b>		
Project:	HSW	
Source:	VideoCS	
Length Bias:	2	
This must be the very first command to issue after the surface state, the pipe select and base address setting commands. This command supports both Long and Short VLD and IT DXVA2 AVC Decoding Interface.		
DWord	Bit	Description
0	31:29	<b>Command Type</b>
		Default Value: 3h PARALLEL_VIDEO_PIPE
		Format: OpCode
	28:27	<b>Pipeline</b>
		Default Value: 2h MFX_AVC_IMG_STATE
		Format: OpCode
	26:24	<b>Media Command Opcode</b>
		Default Value: 1h AVC_COMMON
		Format: OpCode
	23:21	<b>SubOpcode A</b>
Default Value: 0h		
Format: OpCode		
20:16	<b>SubOpcode B</b>	
	Default Value: 0h	
	Format: OpCode	
15:12	<b>Reserved</b>	
	Format: MBZ	
11:0	<b>DWord Length</b>	
	Default Value: 0Ch Excludes DWord (0,1)	
	Format: =n 00Eh, used for normal decode and encode mode000h, a special case to provide a dummy image state for stitch mode operation. In this case, fields in DW1 which is part of the dummy image state command are ignored by hardware.	
1	31:16	<b>Reserved</b>

## MFX\_AVC\_IMG\_STATE

		10b	4:2:2 picture (not supported)	
		11b	4:4:4 picture (not supported)	
<b>Programming Notes</b>				
It is set to the value of the syntax element read from the current active SPS. The corresponding Monochrome Flag (monochrome_flag) can be derived from this field.				
9	<b>Reserved</b>			
	Format:	MBZ		
8	<b>MbMvFormatFlag</b>			
	Use MB level MvFormat flag (Encoder Only)			
	<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>
	0	IGNORE	HW PAK ignore MvFormat in the MB data. When bit 12 == 0, all MBs use packed MV format. When bit 12 == 1, each MB data must use unpacked MV format, 8MV when there is no minor MV involved, and 32MV if there are some minor MVs.	
	1	FOLLOW	HW PAK will follow MvFormat value set within each MB data.	HSW
<b>Programming Notes</b>				
They must take one of the two values: the 8MV unpacked format (MvFormat = 101b), and the 32MV unpacked format (MvFormat = 110b). This bit can be set only when MvUnpackedFlag (bit 12 of this register) is set otherwise system could hang.				
7	<b>EntropyCodingFlag</b>			
	Entropy Coding Flag, entropy_coding_flag			
	<b>Value</b>	<b>Name</b>	<b>Description</b>	
	0	CAVLC bit-serial encoding mode	Desc	
	1	CABAC bit-serial encoding mode.	Desc	
<b>Programming Notes</b>				
It specifies one of the two possible bit stream encoding modes in the AVC. It is set to the value of the syntax element read from the current active PPS.				
6	<b>ImgDisposableFlag</b>			
	Current Img Disposable Flag or Non-Reference Picture Flag			
	<b>Value</b>	<b>Name</b>	<b>Description</b>	
	0	REFERENCE	the current decoding picture may be used as a reference picture for others	
	1	DISPOSABLE	the current decoding picture is not used as a reference picture (e.g. a B-picture cannot be a reference picture for any	

## MFX\_AVC\_IMG\_STATE

									subsequent decoding)
<b>Programming Notes</b>									
It is derived from <code>ImgDisposableFlag = (nal_ref_idc == 0)</code> . <code>nal_ref_idc</code> is a syntax element from a NAL unit. When this flag is set, no reference picture and DMV are written out. This field is only valid for VLD decoding mode.									
5	<b>ConstrainedIPredFlag</b> Constrained Intra Prediction Flag, <code>constrained_ipred_flag</code> It is set to the value of the syntax element in the current active PPS.								
	<b>Value</b>	<b>Name</b>	<b>Description</b>						
	0	INTRA_AND_INTER	allows both intra and inter neighboring MB to be used in the intra-prediction encoding of the current MB.						
	1	INTRA_ONLY	allows only to use neighboring Intra MBs in the intra-prediction encoding of the current MB. If the neighbor is an inter MB, it is considered as not available.						
4	<b>Direct8x8InfFlag</b> Direct 8x8 Inference Flag, <code>direct_8x8_inference_flag</code> It is set to the value of the syntax element in the current active SPS. It specifies the derivation process for luma motion vectors in the Direct MV coding modes (B_Skip, B_Direct_16x16 and B_Direct_8x8). When <code>frame_mbs_only_flag</code> is equal to 0, <code>direct_8x8_inference_flag</code> shall be equal to 1. It must be consistent with the <code>frame_mbs_only_flag</code> and <code>transform_8x8_mode_flag</code> settings.								
	<b>Value</b>	<b>Name</b>	<b>Description</b>						
	0	SUBBLOCK	allows subpartitioning to go below 8x8 block size (i.e. 4x4, 8x4 or 4x8)						
	1	BLOCK	allows processing only at 8x8 block size. MB Info is stored for 8x8 block size.						
3	<b>Transform8x8Flag</b> 8x8 IDCT Transform Mode Flag, <code>trans8x8_mode_flag</code> Specifies 8x8 IDCT transform may be used in this picture It is set to the value of the syntax element in the current active PPS.								
	<b>Value</b>	<b>Name</b>	<b>Description</b>						
	0	4x4	no 8x8 IDCT Transform, only 4x4 IDCT transform blocks are present						
	1	8x8	8x8 Transform is allowed						
2	<b>FrameMbOnlyFlag</b> Frame MB only flag, <code>frame_mbs_only_flag</code> It is set to the value of the syntax element in the current active SPS.								
	<b>Value</b>	<b>Name</b>	<b>Description</b>						
	0	FALSE	not true ; effectively enables the possibility of MBAFF mode.						
	1	TRUE	true, only frame MBs can occur in this sequence, hence disallows the						

## MFX\_AVC\_IMG\_STATE

MFX_AVC_IMG_STATE																							
			MBAFF mode and field picture.																				
	1	<p><b>MbaffFlameFlag</b> MBAFF mode is active, mbaff_frame_flag. It is derived from MbaffFrameFlag = (mb_adaptive_frame_field_flag &amp;&amp; ! field_pic_flag ). mb_adaptive_frame_field_flag is a syntax element in the current active SPS and field_pic_flag is a syntax element in the current Slice Header. They both are present only if frame_mbs_only_flag is 0. Although mbaff_frame_flag is a Slice Header parameter, its value is expected to be the same for all the slices of a picture. It must be consistent with the mb_adaptive_frame_field_flag, the field_pic_flag and the frame_mbs_only_flag settings. This bit is valid only when the img_structure[1:0] indicates the current picture is a frame.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>FALSE</td> <td>not in MBAFF mode</td> </tr> <tr> <td>1</td> <td>TRUE</td> <td>in MBAFF mode</td> </tr> </tbody> </table>		Value	Name	Description	0	FALSE	not in MBAFF mode	1	TRUE	in MBAFF mode											
Value	Name	Description																					
0	FALSE	not in MBAFF mode																					
1	TRUE	in MBAFF mode																					
	0	<p><b>FieldPicFlag</b> Field picture flag, field_pic_flag, specifies the current slice is a coded field or not. It is set to the same value as the syntax element in the Slice Header. It must be consistent with the img_structure[1:0] and the frame_mbs_only_flag settings. Although field_pic_flag is a Slice Header parameter, its value is expected to be the same for all the slices of a picture.</p> <table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>0h</td> <td>FRAME</td> <td>a slice of a coded frame</td> </tr> <tr> <td>1h</td> <td>FIELD</td> <td>a slice of a coded field</td> </tr> </tbody> </table>		Value	Name	Description	0h	FRAME	a slice of a coded frame	1h	FIELD	a slice of a coded field											
Value	Name	Description																					
0h	FRAME	a slice of a coded frame																					
1h	FIELD	a slice of a coded field

## MEDIA\_OBJECT\_PRT

MEDIA_OBJECT_PRT			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
<p>command is for generating Persistent Root Thread for the media pipeline. It only supports loading of inline data but not indirect data.</p> <p>This command should be used for a root thread that might have to be present in the system for a period longer than the certain minimal context-switch interrupt latency. It has to honor the context interrupt signal to terminate upon request. It should also handle replay from the interrupted point upon context restore (the same thread being dispatched more than once). In contrary, if a thread is not a Persistent Root Thread, if dispatched, it must run to completion.</p> <p>The command can be used in all VFE modes, except VLD mode.</p> <p>For simplification, _PRT command has a fixed size of 16 DWORD</p>			
DWord	Bit	Description	
0	31:29	<b>Command Type</b>	
		Default Value:	3h GFXPIPE

1	31:6	<b>Reserved</b>	

## MEDIA\_OBJECT\_PRT

		Format:	MBZ
	5:0	<b>Interface Descriptor Offset</b>	
		Project:	DevHSW+
		Format:	U6
		This field specifies the offset from the interface descriptor base pointer to the interface descriptor which will be applied to this object. It is specified in units of interface descriptors.	
2	31	<b>Children Present</b>	
		Format:	Enable
		Indicates that the root thread may send spawn messages to spawn child threads and/or synchronized root threads. If Children Present is not set, TS signals VFE to dereference the URB handle immediately after it receives acknowledgement from TD that the thread is dispatched. If Children Present is set, the URB handle is forwarded to the root thread and serves as the return URB handle for the root thread. TS does not signal dereference at the time of dispatch. TS signals URB handle dereference only when it receives a resource dereference message from the thread. In order avoid deadlock, such de-reference must be issued once and only once for each URB handle.	
	30:24	<b>Reserved</b>	
		Format:	MBZ
	23	<b>PRT_Fence Needed</b>	
		Format:	Enable
		This field specifies that a PRT_Fence is generated after dispatching the thread associated with this MEDIA_OBJECT_PRT. The PRT_Fence prevents additional threads following this persistent root thread until a thread spawn message is sent. The PRT_Fence is generated on first dispatch of the persistent root, as well as on re-dispatches of the persistent root after context restore.	
	22	<b>PRT_FenceType</b>	
		This field specifies the type of fence the PRT thread uses. If this field is set to 0, the fence is set at the end of the root thread queue. It will block the dispatch of the next root thread, but allowed these root threads to be populated through VFE to the root thread queue in TS. If this field is set to 1, the fence is set at the entry of VFE, similar to the fence set by the MEDIA_STATE_FLUSH command. No more command can go into the media pipe until a thread spawn message is sent (by the PRT). This field is only valid when PRT_Fence Needed is set to 1. Otherwise, it is ignored by hardware.	
		<b>Value</b>	<b>Name</b>
		0h	Root thread queue
		1h	VFE state flush

## MFX\_AVC\_DIRECTMODE\_STATE

MFX_AVC_DIRECTMODE_STATE			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>This is a picture level command and is issued once per picture. All DMV buffers are treated as standard media surfaces, in which the lower 6 bits are used for conveying surface states. Current Pic POC number is assumed to be available in POCList[32 and 33] of the MFX_AVC_DIRECTMODE_STATE Command. This command is only valid in the AVC decoding in VLD and IT modes, and AVC encoder mode. The same command supports both Long and Short DXVA2 AVC Interface. The DMV buffers are not required to be programmed for encoder mode.</p>

1	31:6	<b>Direct MV Buffer Base Address for Picture 0 (current or reference top field)</b>	
		Format:	GraphicsAddress[31:6]
<p>This field provides the base address of the DMV write buffer to store motion vectors decoded in the current picture (top field), which may be used later as a collocated motion information read</p>			

## MFX\_AVC\_DIRECTMODE\_STATE

		<p>buffer of the associated reference picture in decoding subsequent B-pictures that have MB coded in direct mode. It is a private buffer used by the MPR hardware only. Its content is not accessed by software. This buffer must be 64-byte cacheline aligned. The write buffer size is 557,056 bytes for 1 frame. Scalable with frame height, but do not scale with frame width as the hardware assumes frame width (in MBs) fixed at 128 (smallest power of 2 value larger than 120 - 1920x1088 screen resolution). It is only valid if the current picture is a progressive frame, MbAff frame, or a top field. There are a total of 32 reference picture (previously decoded) Direct MV Buffers (0 to 31, not including the DMV write buffer 32 and 33 of the current picture) to read in the corresponding collocated DMV and motion information. For reference picture, these 32 DMV read Buffers can be indexed by the frame_store_ID[4:0], which is obtained from RefPicList L0/L1[RefPicIdx]. frame_Store_IDbit[0] (indicator for Top/Bottom Field). For writing out motion information during the decoding of the current picture, all 34 DMV buffers can be addressed by [img_dec_fs_idc[4:0] &lt; 1 + img_structure[1]].</p>															
	5:4	<p><b>Direct MV Buffer - Arbitration Priority Control</b> This field controls the priority of arbitration used in the GAC/GAM pipeline for this surface.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Value</th> <th style="text-align: center;">Name</th> <th style="text-align: center;">Description</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">00b</td> <td>Highest priority</td> <td>Desc</td> </tr> <tr> <td style="text-align: center;">01b</td> <td>Second highest priority</td> <td>Desc</td> </tr> <tr> <td style="text-align: center;">10b</td> <td>Third highest priority</td> <td></td> </tr> <tr> <td style="text-align: center;">11b</td> <td>Lowest priority</td> <td></td> </tr> </tbody> </table> <p style="text-align: center;"><b>Programming Notes</b></p> <p>This field of Picture 0 DMV Buffer must always be programmed, regardless if this buffer is active or not, exist or not. 35..68	31:0	<p><b>POC List, POCList[34][31:0]</b></p> <p>Each POC value is a signed 32-bit number. One-to-one correspondence with the 34 Direct MV Buffer Address for Reference and Current Frames/Fields. There are 34 POC entries in the list. For reference picture, only the lower 32 POC [0-31] entries can be used, and POCList[ ] is indexed by the frame_store_ID[4:0], which is obtained from RefPicList L0/L1[RefPicIdx]. frame_Store_IDbit[0] (indicator for Top/Bottom Field). For current picture, all 34 POC entries [0-33] can be addressed by POCList[ img_dec_fs_idc[4:0] &lt;&lt; 1 + img_structure[1] ]. For frame-only mode, every other entry is skipped. For MBAFF and field-only picture, each entry is a field POC, and every two entries are paired.</p>				

## MFX\_AVC\_DIRECTMODE\_STATE

MFX_AVC_DIRECTMODE_STATE			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>This is a picture level command and is issued once per picture. All DMV buffers are treated as standard media surfaces, in which the lower 6 bits are used for conveying surface states. Current Pic POC number is assumed to be available in POCList[32 and 33] of the MFX_AVC_DIRECTMODE_STATE Command. This command is only valid in the AVC decoding in VLD and IT modes, and AVC encoder mode. The same command supports both Long and Short DXVA2 AVC Interface. The DMV buffers are not required to be programmed for encoder mode.</p>

## MFX\_AVC\_SLICE\_STATE

<b>MFX_AVC_SLICE_STATE</b>		
Project:	HSW	
Source:	VideoCS	
Length Bias:	2	
This is a slice level command and can be issued multiple times within a picture that is comprised of multiple slices. The same command is used for AVC encoder (PAK mode) and decoder (VLD and IT modes).		
<b>Programming Notes</b>		
MFX_AVC_SLICE_STATE command is not issued for AVC DXVA2 Short Format Bitstream decode, instead MFD_AVC_SLICEADDR command is executed to retrieve the next slice MB Start Address X and Y by H/W itself.

		Exists If:	//Decoder Only
		The MB number (linear MB address in a picture) at the start of a Slice, it must match with the Slice Horizontal Position (Slice_MB_Start_Hor_Pos) and Vertical Position (Slice_MB_Start_Vert_Pos) in the picture.	
		<b>Programming Notes</b>	
		In creating the Phantom Slice for error concealment, this field should set to the total number of MB in the current picture + 1.	
5	31:24	<b>Reserved</b>	

## MFX\_AVC\_SLICE\_STATE

		Format:	MBZ
	23:16	<b>Next Slice Vertical Position</b> This field specifies the position in y-direction of the first macroblock in the next Slice in unit of macroblocks. This field is primarily used for error concealment. In the case that current slice is the last slice, this field should set to the height of picture (since y-direction is zero-based numbering).	
	15:8	Format:	MBZ
	7:0	<b>Next Slice Horizontal Position</b> This field specifies the position in x-direction of the first macroblock in the next Slice in unit of macroblocks. This field is primarily used for error concealment. In the case that current slice is the last slice, this field should set to 0.	
6 Encoder Only	31	<b>Rate Control Counter Enable</b> To enable the accumulation of bit allocation for rate control This field enables hardware Rate Control logic. The rest of the RC control fields are only valid when this field is set to 1. Otherwise, hardware ignores these fields.	
		<b>Value</b>	<b>Name</b>
		0	Disable
		1	Enable
	30	<b>ResetRateControlCounter</b> To reset the bit allocation accumulation counter to 0 to restart the rate control.	
		<b>Value</b>	<b>Name</b>
0		Not Reset	
29:28	<b>RC Triggler Mode</b>		
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	00b	Always Rate Control	Whereas RC becomes active if sum_act > sum_target or sum_act < sum_target
	01b	Gentle Rate Control	whereas RC becomes active if sum_act > upper_midpt or sum_act < lower_midpt
	10b	Loose Rate Control	whereas RC becomes active if sum_act > sum_max or sum_act < sum_min
11b	Reserved		
27:24	<b>RC Stable Tolerance</b>		
	Format:	U4	
	This field specifies the tolerance required to deactivate RC once it has been triggered.		
	<b>Value</b>	<b>Name</b>	
	0-15		

## MFX\_AVC\_SLICE\_STATE

23	<b>RC Panic Enable</b> If this field is set to 1, RC enters panic mode when $\text{sum\_act} > \text{sum\_max}$ . RC Panic Type field controls what type of panic behavior is invoked.	
	<b>Value</b>	<b>Name</b>
	0	Disable
	1	Enable
22	<b>RC Panic Type</b> This field selects between two RC Panic methods	
	<b>Value</b>	<b>Name</b>
	0	QP Panic
	1	CBP Panic
	<b>Programming Notes</b>	
	If it is set to 0, in panic mode, the macroblock QP is maxed out, setting to requested QP + QP_max_pos_mod. If it is set to 1, for an intra macroblock, AC CBPs are set to zero (note that DC CBPs are not modified). For inter macroblocks, AC and DC CBPs are forced to zero.	
21	<b>MB Type Direct Conversion Disable</b> Exists If: <span style="float: right;">//B-Slice</span>	
	For all Macroblock type conversions in different slices, refer to Section "Macroblock Type Conversion Rules" in the same volume.	
	<b>Value</b>	<b>Name</b>
	0	Enable direct mode conversion
	1	Disable direct mode conversion
	<b>Programming Notes</b>	
	This field is zero for all other slices other than B-Slice.	
20	<b>MB Type Skip Conversion Disable</b> Exists If: <span style="float: right;">//P-Slice or B-Slice</span>	
	For all Macroblock type conversions in different slices, refer to Section "Macroblock Type Conversion Rules" in the same volume.	
	<b>Value</b>	<b>Name</b>
	0	Enable skip type conversion
	1	Disable skip type conversion
	<b>Programming Notes</b>	
	This field is zero for all other slices other than P_Slice or B-Slice. \

The LSB of the Mask enables the execution of SIMD32 channel 0; the remaining bits enable the corresponding channel numbers. SIMD16 and SIMD8 dispatches should use the LSB bits of the mask. Any disabled channel will not read or write data to memory.</p>	Format:	Must Be All Ones Must be 0xFFFFFFFF
Format:	Must Be All Ones Must be 0xFFFFFFFF			

## MFX\_AVC\_REF\_IDX\_STATE

<b>MFX_AVC_REF_IDX_STATE</b>		
Project:	HSW	
Source:	VideoCS	
Length Bias:	2	
<p>This is a slice level command and can be issued multiple times within a picture that is comprised of multiple slices. The same command is used for AVC encoder (PAK mode) and decoder (VLD mode); it is not need in decoder IT mode.</p> <p>The inline data of this command is interpreted differently for encoder as for decoder. For decoder, it is interpreted as RefIdx List L0/L1 as in AVC spec., and it matches with the DXVA2 AVC API data structure for decoder in VLD mode : RefPicList[2][32] (L0:L1, 0:31 RefPic). But for encoder, it is interpreted as a Reference Index Mapping Table for L0 and L1 reference pictures. For packing the bits at the output of PAK, the syntax elements must follow the definition of RefIdxL0/L1 list according to the AVC spec. However, the decoder pipeline was designed to use a variation of that standard definition, as such a conversion (mapping) is needed to support the hardware design.</p> <p>The Reference lists are needed in processing both P and B slice in AVC codec. For P-MB, only L0 list is used; for B-MB both L0 and L1 lists are needed. For a B-MB that is coded in L1-only Prediction, only L1 list is used.</p>		
<b>Programming Notes</b>		
<p>DXVA2 specifies that an application will create the RefPicList L0 and L1 and pass onto the driver. The content of each entry of RefPicList L0/L1[ ] is a 7-bit picture index. This picture index is the same as that of RefFrameList[ ] content. This picture index, however, is not defined the same as the frame store ID (0 to 16, 5-bits) we have implemented in H/W. Hence, driver is required to manage a table to convert between DXVA2 picture index and intel frame store ID. As such, the final RefPicList L0/L1[ ] that the driver passes onto the H/W is not the same as that defined in the DXVA2.</p>		
DWord	Bit	Description
0	31:29	<b>Command Type</b>

	Format: OpCode	
23:21	<b>SubOpcodeA</b>	
	Default Value: 0h MFX_AVC_REF_IDX_STATE	

## MFX\_AVC\_REF\_IDX\_STATE

		Format:	OpCode
	20:16	<b>SubOpcodeB</b>	
		Default Value:	4h MFX_AVC_REF_IDX_STATE
		Format:	OpCode
	15:12	<b>Reserved</b>	
		Format:	MBZ
	11:0	<b>DWord Length</b>	
		Default Value:	0008h
		Format:	=n
		Excludes DWords 0,1	
1	31:1	<b>Reserved</b>	
		Format:	MBZ
	0	<b>RefPicList Select</b> Num_ref_idx_l1_active is resulted from the specifications in both PPS and Slice Header for the current slice. However, since the full reference list L0 and/or L1 are always sent, only present flags are specified instead. This parameter is specified for Intel interface only, not present in the DXVA.	
		<b>Value</b>	<b>Name</b> <b>Description</b>
		0	RefPicList 0 The list that followed represents RefList L0 (Decoder VLD mode) or Ref Idx Mapping Table L0 (Encoder PAK mode)
		1	RefPicList1 The list that followed represents RefList L1 (Decoder VLD mode) or Ref Idx Mapping Table L1 (Encoder PAK mode)
2..9	31:0	<b>Reference List Entry</b> This set of fields is always present whenever this command is issued.  It always specifies the full 32 reference pictures in the selected list, regardless they are "existing picture" or not. If a picture is non-existing, the corresponding entry should be set to all ones. Each list entry is 1 byte. A 32-bit DW can hold 4 list entries in the following format	
		<ul style="list-style-type: none"> <li>• 31:24 entry X+3 (e.g. listY_3)</li> <li>• 23:16 entry X+2 (e.g. listY_2)</li> <li>• 15:8 entry X+1 (e.g. listY_1)</li> <li>•</li> </ul>	

## MFX\_AVC\_REF\_IDX\_STATE

7:0 entry X (e.g. listY\_0)

X is replaced by the  $\text{paddr}[2:0] * 4$  ;  $\text{paddr}[5:0]$  with 0x20 and 0x27, and Y is replaced by 0 or 1.  
The byte definition for a reference picture :

- Bit 7 : Non-Existing - indicates that frame store index that should have been at this entry did not exist and was replaced by an index 0 (a valid entry) for error concealment
- Bit 6 : Long term bit - set this reference picture to be used as long term reference
- Bit 5 : Field picture flag - indicates frame/field
- Bit 4:0 : Frame store index or Frame Store ID (Bit 4:1 is used to form the binding table index in intel implementation)

This is the final Reference List L0 or L1 after any reordering specified in the Slice Header as well as modified by the driver, and its indices values are all translated to the intel specification.

If the reference picture is a frame (Bit5 = 1), frame store ID is always an even number.

This list is used in outputting MV information by the BSD unit in VLD mode. DMV access also reads and writes Mvlist0 using this frame store ID.

If this set of fields is interpreted as Reference Index Mapping Table L0/L1, the same field alignment is followed, i.e. 4 mapping entries per DW. Each mapping entry is one byte in size, but only the least significant 5 bits [4:0] is relevant. Driver should zero all the upper bits [7:5] for each entry.

## MFX\_AVC\_WEIGHTOFFSET\_STATE

MFX_AVC_WEIGHTOFFSET_STATE			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>This is a slice level command and can be issued multiple times within a picture that is comprised of multiple slices. The same command is used for AVC encoder (PAK mode) and decoder (VLD and IT modes). However, since for AVC decoder VLD and IT modes, and AVC encoder mode, the implicit weights are computed in hardware, this command is not issued. For encoder, regardless of the type of weight calculation is active for the current slice (default, implicit or explicit), they are all sent to the PAK as if they were all in explicit mode. However, for implicit weight and offset, each entry contains only a 16-bit weight and no offset (offset = 0 always in implicit mode and can be hard-coded inside the hardware).The weights (and offsets) are needed in processing both P and B slice in AVC codec. For P-MB, at most only L0 list is used; for B-MB both L0 and L1 lists may be needed. For a B-MB that is coded in L1-only Prediction, only L1 list is sent.The content of this command matches with the DXVA2 AVC API data structure for explicit prediction mode only : Weights[2][32][3][2] (L0:L1, 0:31 RefPic, Y:Cb:Cr, W:0)</p>

Value	Name	Description																		
0		Specifies that all luma and chroma block edges of the slice are filtered																		
1h		Specifies that deblocking is disabled for all block edges of the slice																		
2h		Specifies that all luma and chroma block edges of the slice are filtered, but with no filtering across slice boundaries.																		
3h		specifies a two stage deblocking filter process for the slice : All luma and chroma block edges of the slice are filtered, but with no filtering across slice boundaries (as if disable_deblocking_filter_idc were equal to 2), Then luma and chroma block edges that coincide with slice boundaries are filtered in the second pass.																		

## MFX\_SVC\_IMG\_STATE

		4h		specifies that all luma block edges of the slice are filtered, but the deblocking of the chroma block edges is entirely disabled. Similar to case 0, with chroma deblocking disabled
		5h		specifies that only all luma block edges of the slice are filtered, but with no filtering across slice boundaries.), and that deblocking for chroma block edges of the slice is entirely disabled. Similar to case 2, with chroma deblocking disabled
		6h		specifies a two stage deblocking filter process for only luma block edges of the slice, and that deblocking for chroma block edges of the slice is entirely disabled. Similar to case 3, with chroma deblocking disabled.
		<b>Programming Notes</b>		
		When DisableIL_DLKFilterIdc is present, quality_id is equal to 0, and SpatialResolutionChangeFlag is equal to 0, disable_inter_layer_deblocking_filter_idc shall be equal to 1. <b>DisableIL_DLKFilterIdc Should be the same across the slices.</b>		
		Interlayer reconstructed pixels prior to the interlayer deblocking are the same pixels prior to regular reconstructed pixel deblocking.		
	10	<b>Reserved</b>		
		Format:		MBZ
	9	<b>TargetLayerFlag</b>		
		This field specifies whether the current layer is the target layer to be fully reconstructed (including inter MB, which require motion compensation operation) or not. This field can be set when the current layer is the final target layer or base quality layer (with DependencyId = DependencyIdMax and (when StoreRefBasePicFlag is set). TargetLayerFlag is set for both Target Layer or QBL pixel reconstruction. HW does not have notion of QBL. QBL is always processed in 2 passes - one pass as with TargetLayerFlag set to 1, and the second pass as a regular spatial upsampled layer (to streamout data for the next layer).		
		Decoding pass		Used
		Encoding pass		Used
		Inter-layer upsampling pass		Not Used
		<b>Value</b>	<b>Name</b>	<b>Description</b>
		0		The current layer is not target layer or QBL and does not need to be reconstructed
		1		The current layer is set to target layer or QBL and need to be reconstructed.

5	31:0	<b>IL_PixLumaScaleX</b>	
		Format:	U32
		This field is set equal to ScaleX computed as in equation G-47 in Spec for luma component. This field is used to derive the reference layer sample location in units of 1/16th in resampling, given the luma location (xP, yP) at the current layer.	
		<b>Programming Notes</b>	
		This value is computed by driver.	
6	31:0	<b>IL_PixLumaScaleY</b>	
		This field is set equal to ScaleY computed as in equation G-48 in Spec for luma component. This field is used to derive the reference layer sample location in units of 1/16th in resampling, given the luma location (xP, yP) at the current layer.	
		<b>Programming Notes</b>	
		This value is computed by driver.	
7	31:0	<b>IL_PixLumaAddX</b>	
		This field is set equal to AddY computed as in equation of G-50 in spec for luma component. This field is used to derive the reference layer sample location in units of 1/16th in resampling, given the luma location (xP, yP) at the current layer.	
		<b>Programming Notes</b>	
		This value is computed by driver.	
8	31:0	<b>IL_PixLumaAddYbf0</b>	
		This field is set equal to AddY computed as in equation of G-53 in spec for luma component. This field is used to derive the reference layer sample location in units of 1/16th in resampling, given the luma location (xP, yP) at the current layer.	
		<b>Programming Notes</b>	
		This value is computed by driver.	
9	31:0	<b>IL_PixLumaAddYbf1</b>	
		This field is set equal to AddY computed as in equation of G-56 in spec for luma component. This field is used to derive the reference layer sample location in units of 1/16th in resampling, given the luma location (xP, yP) at the current layer. This value is computed by driver.

If this flag is set, HW will reconstruct the slice pixel internally in both encoder and decoder process with inferred data only.</p> <p>In the decode mode, the syntax elements for the macroblock layer of the slice are derived by the following process:</p> <ul style="list-style-type: none"> <li>• CurrMbAddr is equal to first_mb_in_slice * ( 1 + MbaffFrameFlag );</li> <li>• The variable mbIdx proceeds over the values 0..num_mbs_in_slice_minus1, and for each value of mbIdx, the following ordered steps are specified:             <ol style="list-style-type: none"> <li>a. The bitstream shall not contain data that result in InCropWindow( CurrMbAddr ) equal to 0.</li> <li>b. For the macroblock with address CurrMbAddr, the syntax elements mb_skip_flag (when applicable), mb_skip_run (when applicable), mb_field_decoding_flag, base_mode_flag, residual_prediction_flag and coded_block_pattern shall be inferred as follows:                 <ul style="list-style-type: none"> <li>○ mb_skip_flag (when applicable) and mb_skip_run (when applicable) are inferred to be equal to 0.</li> <li>○ mb_field_decoding_flag is inferred to be equal to 0.</li> <li>○ base_mode_flag is inferred to be equal to 1.</li> </ul> </li> </ol> </li> </ul>	Format:	U1	
Format:	U1			

## MFX\_SVC\_SLICE\_STATE

- o residual\_prediction\_flag is inferred to be equal to 1.
  - o coded\_block\_pattern is inferred to be equal to 0.
  - o QPY is inferred to be equal to SliceQPY.
  - o QP'Y is inferred to be equal to (QPY + QpBdOffsetY).
- c. When the variable mbIdx is less than num\_mbs\_in\_slice\_minus1, CurrMbAddr is set to NextMbAddress( CurrMbAddr ). The bitstream shall not contain data that result in CurrMbAddr being set equal to a value that is not less than PicSizeInMbs.

Value	Name	Description
0		The slice data in scalable extension syntax structure is present in the NAL unit
1		The slice data in scalable extension syntax structure is not present in the NAL unit.

7 **TcoeffLvlPredFlag**

Format:	U1
---------	----

Value	Name	Description
0		The coeff prediction is performed in stCoeff if applicable.
1		The coeff prediction is performed in tCoeff and prediction modes are inferred from reference layer when applicable.

### Programming Notes

When tcoeff\_level\_prediction\_flag is equal to 1, the following constraints shall be obeyed:

- a. The slices of the reference layer representation (with DQId equal to ref\_layer\_dq\_id) shall have no\_inter\_layer\_pred\_flag equal to 1 or tcoeff\_level\_prediction\_flag equal to 1;
- b. All elements of ScalingList4x4 shall be the same for the slices of the current layer representation and all slices of the reference layer representation (with DQId equal to the value of ref\_layer\_dq\_id);
- c. All elements of ScalingList8x8 shall be the same for the slices of the current layer representation and all slices of the reference layer representation (with DQId equal to the value of ref\_layer\_dq\_id);
- d. The value of the syntax element use\_ref\_base\_pic\_flag shall be equal to 0 for the slices of the current layer representation and all slices of the reference layer representation (with DQId equal to the value of ref\_layer\_dq\_id);
- e. When slice\_skip\_flag is equal to 1, the value of constrained\_intra\_pred\_flag for the current layer representation shall be identical to the value of constrained\_intra\_pred\_flag for the reference layer representation (with DQId equal to ref\_layer\_dq\_id).

6 **AdaptMotionPredFlag**

Format:	U1
---------	----

Value	Name	Description
-------	------	-------------

## MFX\_SVC\_SLICE\_STATE

	0		motion prediction flag is not present in the macroblock layer in scalable extension.
	1		motion prediction flag is present in the macroblock layer in scalable extension.
5	<b>DefaultMotionPredFlag</b>		
	Format:		U1
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	0		Motion_prediction_flag_I0 and motion_prediction_flag_I1 are inferred to be 0 when they are not present in macroblock layer in scalable extension.
	1		Motion_prediction_flag_I0 and motion_prediction_flag_I1 are inferred to be 1 when they are not present in macroblock layer in scalable extension.
	<b>Programming Notes</b>		
	If AdaptiveMotionPredFlag is 1, this field is ignored.		
4	<b>AdaptResidPredFlag</b>		
	Format:		U1
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	0		Residual prediction flag is not present in the macroblock layer in scalable extension.
	1		Residual prediction flag is present in the macroblock layer in scalable extension.
3	<b>DefaultResidPredFlag</b>		
	Format:		U1
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	0		Residual_prediction_flag is inferred to be 0 when they are not present in macroblock layer in scalable extension.
	1		Residual_prediction_flag is inferred to be 1 when they are not present in macroblock layer in scalable extension.
2	<b>AdaptBaseModeFlag</b>		
	Format:		U1
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	0		Base mode flag is not present in the macroblock in scalable extension;
	1		Base mode flag is present in the macroblock in scalable extension.
	<b>Programming Notes</b>		
	If default base mode flag = 1, the adaptive motion prediction flag and default motion		

## MFX\_SVC\_SLICE\_STATE

		prediction flag is not present in the slice header.		
1	<b>DefaultBaseModeFlag</b>			
	Format:		U1	
	<b>Value</b>	<b>Name</b>	<b>Description</b>	
	0		Base mode flag is inferred to be 0 when it is not present in macroblock layer in scalable extension.	
	1		Base mode flag is inferred to be 1 when it is not present in macroblock layer in scalable extension and the adaptive motion prediction flag and default motion prediction flag is not present in slice header.	
	0	<b>NoInterLayerPredFlag</b>		
		Format:		U1
		<b>Value</b>	<b>Name</b>	<b>Description</b>
		0		Macroblocks in the current slice may have inter-layer prediction
		1		Macroblocks in the current slice do not have inter-layer prediction
2	31:19	<b>Reserved</b>		
	Format:		MBZ	
	18:16	<b>Disable_DLKFilterIdc</b>		
	Format:		U3	
	This field specifies whether the operation of the deblocking filter shall be disabled across some block edges of the slice, specifies for which edges the filtering is disabled, and specifies the order of deblocking filter operations.			
	The values 0 to 6h of Disable_DLKFilterIdc specify the deblocking filter operations as follows:			
	<b>Value</b>	<b>Name</b>	<b>Description</b>	
	0		Specifies that all luma and chroma block edges of the slice are filtered	
	1h		Specifies that deblocking is disabled for all block edges of the slice	
	2h		Specifies that all luma and chroma block edges of the slice are filtered, but with no filtering across slice boundaries.	
	3h		specifies a two stage deblocking filter process for the slice : <ul style="list-style-type: none"> <li>a. All luma and chroma block edges of the slice are filtered, but with no filtering across slice boundaries (as if disable_deblocking_filter_idc were equal to 2),</li> <li>b. Then luma and chroma block edges that coincide with slice boundaries are filtered in the second pass.</li> </ul>	
	4h		Specifies that all luma block edges of the slice are filtered, but the deblocking of the chroma block edges is entirely disabled. (Similar to case 0, with chroma deblocking disabled)	

## MFX\_SVC\_SLICE\_STATE

	5h		Specifies that only all luma block edges of the slice are filtered, but with no filtering across slice boundaries.), and that deblocking for chroma block edges of the slice is entirely disabled. (Similar to case 2, with chroma deblocking disabled)
	6h		Specifies a two stage deblocking filter process for only luma block edges of the slice, and that deblocking for chroma block edges of the slice is entirely disabled. (Similar to case 3, with chroma deblocking disabled.)
<b>Programming Notes</b>			
When no_inter_layer_pred_flag is equal to 1 or tcoeff_level_prediction_flag is equal to 1, the value of Disable_DLKFilterIdc shall be in the range of 0 to 2, inclusive.

## MFD\_AVC\_SLICEADDR

<b>MFD_AVC_SLICEADDR</b>			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>This is a Slice level command used only for DXVA2 AVC Short Slice Bitstream Format VLD mode. When decoding a slice, H/W needs to know the last MB of the slice has reached in order to start decoding the next slice. It also needs to know if a slice is terminated but the last MB has not reached, error concealment should be invoked to generate those missing MBs. For AVC DXVA2 Short Format, the only way to know the last MB position of the current slice, H/W needs to snoop into the next slice's start MB address (a linear address encoded in the Slice Header). Since each BSD Object command can have only one indirect bitstream buffer address, this command is added to help H/W to snoop into the next slice's slice header and retrieve its Start MB Address. This command will take the next slice's bitstream buffer address as input (exactly the same way as a BSD Object command), and parse only the first_mb_in_slice syntax element. The result will be stored inside the H/W, and will be used to decode the current slice specified in the BSD Object command. Only the very first few bytes (max 5 bytes for a max 4K picture) of the Slice Header will be decoded, the rest of the bitstream are don't care. This is because the first_mb_in_slice is encoded in Exponential Golomb, and will take 33 bits to represent the max <math>256 \times 256 = 64K-1</math> value. The indirect data of MFD_AVC_SLICEADDR is a valid BSD object and is decoded as in BSD OBJECT command. The next Slice Start MB Address is also exposed to the MMIO interface. The Slice Start MB Address (first_mb_in_slice) is a linear MB address count; but it is translated into the corresponding 2D MB X and Y raster position, and are stored internally as NextSliceMbY and NextSliceMbX.</p>

## MFD\_AVC\_SLICEADDR

	15:12	<b>Reserved</b>	Format: MBZ						
	11:0	<b>DWord Length</b>	Format: =n Total Length - 2						
			<table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> <th>Project</th> </tr> </thead> <tbody> <tr> <td>1h</td> <td>Excludes DWord (0,1) <b>[Default]</b></td> <td>HSW</td> </tr> </tbody> </table>	Value	Name	Project	1h	Excludes DWord (0,1) <b>[Default]</b>	HSW
Value	Name	Project							
1h	Excludes DWord (0,1) <b>[Default]</b>	HSW							
1	27:24	<b>Reserved</b>	Format: MBZ						
	23:0	<b>Indirect BSD Data Length</b>	Format: U24 in bytes This field provides the length in bytes of the indirect data. A value zero indicates that indirect data fetching is disabled - subsequently, the Indirect Data Start Address field is ignored. Driver always programs this up to 5 bytes; for bitstream less than 5 bytes, driver program the lesser value. (Emulation Prevention Byte should never happen for the first 5 bytes when the max picture size can only be 4Kx4K)It is the length in bytes of the bitstream data for the current slice, including Slice Header + Slice Data + Emulation Prevention Bytes + any filling trailing zeros after the last MB. Hardware ignores the contents after the last non-zero byte. Trailing zero is allowed and handled correctly in both CABAC and CAVLC modes.						
2	31:29	<b>Reserved</b>	Format: MBZ						
	28:0	<b>Indirect BSD Data Start Address</b>	This field specifies the Graphics Memory starting address of the data to be fetched into BSD Unit for processing. This pointer is relative to the MFD Indirect Object Base Address.Hardware ignores this field if indirect data is not present. It is a byte-aligned address for the AVC bitstream data in both CABAC/CAVLD Modes.In implementing a phantom slice at the end of a picture for automatic error concealment, this field should set to 0.It includes the NAL Header Byte. (but does not perform EMU detection).Must provide a valid MB address, even if error. MB must be clamped to within a pic boundary.

## MFC\_AVC\_PAK\_OBJECT

<b>MFC_AVC_PAK_OBJECT</b>				
Project:	HSW			
Source:	VideoCS			
Length Bias:	2			
<p>The MFC_AVC_PAK_OBJECT command is the second primitive command for the AVC Encoding Pipeline. The same command is used for both CABAC and CAVLC modes. The MV Data portion of the bitstream is loaded as indirect data object. Before issuing a MFC_AVC_PAK_OBJECT command, all AVC MFX states need to be valid. Therefore the commands used to set these states need to have been issued prior to the issue of this command. MB record must be consecutive with no gaps, hence we do not need MB(x,y) in each MB command. Internal counter will keep track of the current MB address, starting from the Start_MB_In_Slice loaded at the beginning of each slice. MFC_AVC_PAK_OBJECT command follows the MbType definition like MFD. Many fields in this command are identical to that in VME output. This is intended to reduce software converting overhead from VME to PAK. Encoding statistical data such as the total size of the output bitstream are provided through MMIO registers. Software may access these registers through MI_STORE_REGISTER_MEM command.</p>

## MFX\_VC1\_PRED\_PIPE\_STATE

MFX_VC1_PRED_PIPE_STATE		
Project:	HSW	
Source:	VideoCS	
Length Bias:	2	
<p>This command is used to set the operating states of the MFD Engine beyond the BSD unit. It is used with both VC1 Long and Short format. Driver is responsible to take the intensity compensation enable signal, the LumScale and the LumShift provided from the DXVA2 VC1 interface, and maintain a history of these values for reference pictures. Together with these three parameters specified for the current picture being decoded, driver will derive and supply the above sets of LumScaleX, LumShiftX and intensity compensation enable (single or double, forward or backward) signals. H/W is responsible to take these state values, and use them to build the lookup table (including the derivation of iScale and iShift) for remapping the reference frame pixels, as well as performing the actual pixel remapping calculations/process.</p>

## MFX\_VC1\_DIRECTMODE\_STATE

MFX_VC1_DIRECTMODE_STATE			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>This is a picture level command and should be issued only once, even for a multi-slices picture. This command is only valid in the VC1 decoding in VLD modes. There is only one DMV buffer for read (when processing a B-picture) and one for write (when processing a P-Picture). Each DMV record is 64 Bytes per MB, to store the top and bottom field MVs (32-bit MVx,y each). Note that if there is a I picture before a B picture the DmvSurfaceValid state in MFX_VC1_PIC_STATE Command will NOT be set and zero's DMV's will be assumed while decoding the B picture. That is, there is no explicit DMV buffer for an I-picture.</p>

## MFD\_VC1\_SHORT\_PIC\_STATE

4	Format:	MBZ
2	<b>Picture Height</b>	
3:	Format:	U8-1 Picture Height in Macroblocks
1	<p>This field indicates the height of the picture in unit of macroblocks. For example, for a 1920x1080 frame picture, PictureHeightInMBs equals 68 (1080 divided by 16, and rounded up, i.e. effectively specified as 1088 instead). This field is used in VLD and IT modes. Note: Even though the Advanced Profile allows frame dimensions (width, height) to not be aligned to macroblock boundary, it doesn't affect the bitstream decoding. And it is preferable to use 'intermediate buffer' that is macroblock aligned for decoding. In order to simplify the out-of-bound reference pixel access, the out-of-bound extrapolation rule in VC1 spec can be used to expand the expected decoded frame to the intermediate buffer dimension.</p>	
6		
	<b>Value</b>	<b>Name</b>
	[0,255]	[1, 256] MB
1	<b>Reserved</b>	
5:	Project:	All
8	Format:	MBZ
7:	<b>Picture Width</b>	
0	Format:	U8-1 Picture Width in Macroblocks
	<p>This field indicates the width of the picture in unit of macroblocks. For example, for a 1920x1080 frame picture, PictureWidthInMBs equals 120 (1920 divided by 16). This field is used in VLD and IT modes.</p>	
	<b>Value</b>	<b>Name</b>
	[0,255]	[1, 256] MB
2	<b>Bitplane Buffer Pitch Minus 1</b>	
1:	Format:	U7-1 Pitch in Bytes
2	<p>Specifies the bitplane buffer pitch in (#Bytes - 1). Bitplane buffer is a linear buffer. It is needed only when the bitplane is not encoded as raw, and therefore is present in the header explicitly. In VC1 Long Format (Gen6 and Gen7), it is written by an application and later read by the HW. In VC1 Long Format (Gen6 and Gen7), it is written by an application, and later read by the HW. But in VC1 Short Format (Gen7 only), it is written and read by H/W only. This field is specified for better performance. For Gen6 : The pitch must be equal to PictureWidthInMBs/2. For Gen7 VC1 Long Format : The pitch must be equal to PictureWidthInMBs/2. For Gen7 VC1 Short Format : If Pic Width is less than or equal to 2K pixels, bitplane pitch is set to 64 (one cacheline; programmed as 63) bytes per MB row. If Pic Width is greater than 2K pixels, bitplane pitch is set to 128 (two cachelines; programmed as 127) bytes per MB row. This field is not used in IT mode, used in VLD mode only. For VC1 DXVA2 Short Format, the bitplane specification is between H/W and Driver only. For Long Format, application is responsible for allocation with the driver.</p>	
4		
2	<b>Interpolation Runder Control</b>	
3	<p>Used only in MC operation. This field specifies the rounding control value used in interpolation operation of motion prediction process.</p> <p>Note: This bit field is taken from bRcontrol in DXVA_PictureParameters data structure</p> <p>This field is used in VLD and IT modes.</p>

## MFD\_VC1\_SHORT\_PIC\_STATE

Access:	None
---------	------

This field specifies whether the reference picture pixel values should be scaled up or scaled down on-the-fly, if RangeReduction is Enabled. NOTE: This bit is derived by driver for Main Profile only. Ignored in Simple and Advanced Profiles. This field is used in both VLD and IT modes. This is derived by driver from the history of RANGERED and RANGEREDFRM syntax elements (i.e. of forward/preceding reference picture) and those of the current picture. RANGERED is the same as (bPicOverflowBlocks >> 3) & 1. RANGEREDFRM is the same as (bPicDeblocked >> 5) & 1. For the current picture is a B picture, this field represents the state of the forward/preceding reference picture only. Driver is responsible to keep RangeReductionScale, RangeReduction Enable and RANGERED Present Flag of current picture coherent.

Value	Name	Description	Project
0h	Disable <b>[Default]</b>	Scale down reference picture by factor of 2	All
1h	Enable	Scale up reference picture by factor of 2	All

### 2 Range Reduction Enable

Project:	All
----------	-----

This field specifies whether on-the-fly pixel value range reduction should be performed for the preceding (or forward) reference picture. Along with RangeReductionScale to specify whether scale up or down should be performed. It is not the same value as RANGEREDFRM Syntax Element (DXVA\_PictureParameters bPicDeblocked bit 5) in the Picture Header. This field is for Main Profile only. Simple Profile is always disable, and not applicable to Advanced Profile. This field is used in both VLD and IT modes. This is derived by driver from the history of RANGERED and RANGEREDFRM syntax elements (i.e. of forward/preceding reference picture) and those of the current picture. RANGERED is the same as (bPicOverflowBlocks >> 3) & 1. RANGEREDFRM is the same as (bPicDeblocked >> 5) & 1. For the current picture is a B picture, this field represents the state of the forward/preceding reference picture only. Driver is responsible to keep RangeReductionScale, RangeReduction Enable and RANGERED Present Flag of current picture coherent.

Value	Name	Description	Project
0h	Disable <b>[Default]</b>	Range reduction is not performed	All
1h	Enable	Range reduction is performed	All

### 2 Reserved

Project:	All
Format:	MBZ

### 2 Progressive Pic Type

3: This field is used in both DXVA2 VC1 VLD mode and IT mode. It is the same parameter as bPicExtrapolation in DXVA2 VC1 spec. The Picture Structure and Progressive Pic Type are used to derive the picture structure as specified in FCM, in DXVA2 VC1 VLD and IT mode.

Value	Name	Description	Project
0		progressive only picture	All
1		progressive only picture	All
2		interlace picture (frame-interlace or field-interlace)

8				
7	<b>PANSCAN Present Flag</b>			
	<b>Value</b>	<b>Name</b>	<b>Description</b>	
	0		Pan Scan Parameters are not present in the picture header	
	1		Pan Scan Parameters are present in the picture header	
6	<b>REFDIST_FLAG</b>			
	For header parsing REFDIST.This is used in DXVA2 VC1 VLD mode only, not used in IT and intel VC1 VLD modes.			
5	<b>LOOPFILTER Enable Flag</b>			
	This field is the decoded syntax element LOOPFILTER in bitstream. It indicates if In-loop Deblocking is ON according to picture level bitstream syntax control. This bit affects BSD unit and also the loop filter unit. When this bit is set to 1, PostDeblockOutEnable field in MFX_PIPE_MODE_SELECT command must also be set to 1. In this case, in-loop deblocking operation follows the VC1 standard - deblocking doesn't cross slice boundary. When this bit is set to 0, but PostDeblockOutEnable field in MFX_PIPE_MODE_SELECT command is set to 1. It indicates the loop filter unit is used for out-of-loop deblocking. In this case, deblocking operation does cross slice boundary. This field is used in VLD mode only, not in IT mode.			
	<b>Value</b>	<b>Name</b>	<b>Description</b>	
	0		In-Loop-Deblocking-Filter is disabled	
	1		In-Loop-Deblocking-Filter is enabled	
4	<b>FastUVMCFlag (Fast UV Motion Compensation Flag)</b>			
	This field specifies whether the motion vectors for UV is rounded to half or full pel position. It is identical to the variable FASTUVMC in VC1 standard. This field is used in both VLD and IT modes. It is derived from $FASTUVMC = (bPicSpatialResid8 \gg 4) \& 1$ in both VLD and IT modes, and should have the same value as Motion Vector Mode LSBit.			
	<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>
	0h		no rounding	All
	1h		quarter-pel offsets to half/full pel positions	All
3	<b>EXTENDED_MV Present Flag</b>

## MFD\_VC1\_LONG\_PIC\_STATE

MFD_VC1_LONG_PIC_STATE			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>MFX_VC1_LONG_PIC_STATE command encapsulates the decoding parameters that are read or derived from bitstream syntax elements above (inclusive) picture header layer. These parameters are static for a picture and when slice structure is present, these parameters are not changed from slice to slice of the same picture. Hence, this command is only issued at the beginning of processing a new picture and prior to the VC1_*_OBJECT command. The values set for these state variables are retained internally across slices. Only the parameters needed by hardware (BSD unit) to decode bit sequence for the macroblocks in a picture layer or a slice layer are presented in this command. Other parameters such as the ones used for inverse transform or motion compensation are provided in MFX_VC1_PRED_PIPE_STATE command. This Long interface format is intel proprietary interface. Driver will need to perform addition operations to generate all the fields in this command.</p>			
DWord	Bit	Description

## MFD\_VC1\_LONG\_PIC\_STATE

		Project:	All	
		Format:	=n Total Length - 2	
1	31:24	<b>Reserved</b>		
		Project:	HSW	
		Format:	MBZ	
	23:16	<b>PictureHeightInMBsMinus1 (Picture Height Minus 1 in Macroblocks)</b>		
		Project:	HSW	
		Format:	U8	
		<p>This field indicates the height of the picture in unit of macroblocks. For example, for a 1920x1080 frame picture, PictureHeightInMBs equals 68 (1080 divided by 16, and rounded up, i.e. effectively specified as 1088 instead). This field is used in VLD and IT modes.</p>		
		<b>Value</b>	<b>Name</b>	<b>Description</b>
		[0,255]		a valid range of [0,255] [1, 256] MB
	<b>Programming Notes</b>			
<p>Note: Even though the Advanced Profile allows frame dimensions (width, height) to not be aligned to macroblock boundary, it doesn't affect the bitstream decoding. And it is preferable to use 'intermediate buffer' that is macroblock aligned for decoding. In order to simplify the out-of-bound reference pixel access, the out-of-bound extrapolation rule in VC1 spec can be used to expand the expected decoded frame to the intermediate buffer dimension.</p>				
15:8	<b>Reserved</b>			
	Project:	HSW		
	Format:	MBZ		
7:0	<b>PictureWidthInMBsMinus1 (Picture Width Minus 1 in Macroblocks)</b>			
	Project:	HSW		
	Format:	U8-1		
	<p>This field indicates the width of the picture in unit of macroblocks. For example, for a 1920x1080 frame picture, PictureWidthInMBs equals 120 (1920 divided by 16). This field is used in VLD and IT modes</p>			
	<b>Value</b>	<b>Name</b>	<b>Description</b>	
[0,255]		[1,256] MB		
2	31:24	<b>Bitplane Buffer Pitch Minus 1</b>		
		Project:	HSW	
		Format:	U7-1 Pitch in (Bytes - 1).	
		<p>Specifies the bitplane buffer pitch in (#Bytes - 1). Bitplane buffer is a linear buffer. It is needed only when the bitplane is not encoded as raw, and therefore is present in the header explicitly. In VC1 Long Format (Gen6 and Gen7), it is written by an application and later read by the HW. But in VC1 Short Format (Gen7 only), it is written and read by H/W only. This field is specified for better performance</p>		

## MFD\_VC1\_LONG\_PIC\_STATE

		Value	Name
		[0,FFFFFFFFh]	
		<b>Programming Notes</b>	
		<p>For Gen6 : The pitch must be equal to PictureWidthInMBs/2.For Gen7 VC1 Long Format : The pitch must be equal to PictureWidthInMBs/2.For Gen7 VC1 Short Format : If Pic Width is less than or equal to 2K pixels, bitplane pitch is set to 64 (one cacheline; programmed as 63) bytes per MB row. If Pic Width is greater than 2K pixels, bitplane pitch is set to 128 (two cachelines; programmed as 127) bytes per MB row.This field is not used in IT mode, used in VLD mode only.For VC1 DXVA2 Short Format, the bitplane specification is between H/W and Driver only. For Long Format, application is responsible for allocation with the driver.</p>	
23:16	<b>Reserved</b>		
		Project:	HSW
		Format:	MBZ
15	<b>DmvSurfaceValid</b>		
		Project:	HSW
		<p>Indicated when the DMV read surface is valid. This surface stored the direct motion vectors and Mb type.This field is set for B pictures that can refer to a previous P picture for DMV. If there is an I-picture before a B (in decoding order) then this field is not set (as a result, zero's DMV's will be assumed while decoding the B picture. That is, there is no explicit DMV buffer for an I-picture).Whne the current picture being decoded is an I, P or BI, this bit is set to 0, since there is no DMV read in these picture decoding process.This field is not used in IT mode, used in VLD mode only.</p>	
14	<b>ImplicitQuantizer</b>		
		Project:	HSW
		<p>Derived by driver from QUANTIZER.This field is used in intel VC1 VLD Long Format only, not used in IT and DXVA2 VC1.This bit is set to 1 when syntax element QUANTIZER=0, else its set to 0</p>	
13	<b>Interpolation Rounder Contro</b>		
		Project:	HSW
		<p>Used only in MC operation. This field specifies the rounding control value used in interpolation operation of motion prediction process.This field is used in VLD and IT modes.</p>	
		<b>Programming Notes</b>	
		<p>This bit field is taken from bRcontrol in DXVA_PictureParameters data structure</p>	
12	<b>SyncMarker</b>		
		Project:	HSW
		<p>Indicates whether sync markers are enabled/disabled. If enable, sync markers "may be" present in the current video sequence being decoded. It is a sequence level syntax element and is valid only for Simple and Main Profiles.</p>	

## MFD\_VC1\_LONG\_PIC\_STATE

		Value	Name	Description	Project
		0h	Not Present	Sync Marker is not present in the bitstream	HSW
		1h	Maybe present	Sync Marker maybe present in the bitstream	HSW
		<b>Programming Notes</b>			
		This field is only valid in VLD mode. For Simple Profile, SyncMarker must set to 0. For Main Profile, SyncMarker can be set to 0 or 1. This field is used in both intel and MS DXVA2 VLD interface, but not used in IT mode.			
11:8	<b>Motion Vector Mode</b>	Project: HSW			
		This field indicates one of the following motion compensation interpolation modes for P and B pictures. The MC interpolation modes apply to prediction values of luminance blocks and are always in quarter-sample. For chrominance blocks, it always performs bilinear interpolation with either half-pel or quarter-pel precision. Before the polarity of Chroma Half-pel or Q-pel is reversed from DXVA2 Spec, now I have fixed it to match with DXVA2 VC1 Spec.			
		<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>
		0XX0b		Chroma Quarter -pel + Luma bicubic. (can only be 1MV)	HSW
		0XX1b		Chroma Half-pel + Luma bicubic. (can be 1MV or 4MV)	HSW
		1XX0b		Chroma Quarter -pel + Luma bilinear. (can only be 1MV)	HSW
		1XX1b		Chroma Half-pel + Luma bilinear	HSW
		<b>Programming Notes</b>			
		Bits 11:8 are taken from bMVprecisionAndChromaRelation in DXVA_PictureParameters data structure. Bit 11 of Motion Vector Mode = 1 for Luma Bilinear MC; = 0 for Luma Bicubic MC. Bit 8 of Motion Vector Mode = 1 for half-sample Chroma motion = 0 for quarter-sample Chroma motion. This field is used in both VLD and IT modes.			
7	<b>RangeReductionScale</b>	Project: HSW			
		This field specifies whether the reference picture pixel values should be scaled up or scaled down on-the-fly, if RangeReduction is Enabled.			
		<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>
		0h		Scale down reference picture by factor of 2	HSW
		1h		Scale up reference picture by factor of 2	HSW
		<b>Programming Notes</b>			
		This bit is derived by driver for Main Profile only. Ignored in Simple and Advanced Profiles. This field is used in both VLD and IT modes. This is derived by driver from the history of RANGERED and RANGEREDFRM syntax elements (i.e. of forward/preceding reference picture) and those of the current picture. RANGERED is the same as (bPicOverflowBlocks >> 3) & 1. RANGEREDFRM			

## MFD\_VC1\_LONG\_PIC\_STATE

is the same as (bPicDeblocked >> 5) & 1. For the current picture is a B picture, this field represents the state of the forward/preceding reference picture onlyDriver is responsible to keep RangeReductionScale, RangeReduction Enable and RANGERED Present Flag of current picture coherent.

### 6 RangeReduction Enable

Project:	HSW
----------	-----

This field specifies whether on-the-fly pixel value range reduction should be performed for the preceding (or forward) reference picture. Along with RangeReductionScale to specify whether scale up or down should be performed. It is not the same value as RANGEREDFRM Syntax Element (DXVA\_PictureParameters bPicDeblocked bit 5) in the Picture Header.

Value	Name	Description	Project
0h	Disable	Range reduction is not performed	All
1h	Enable	Range reduction is performed	All

#### Programming Notes

This field is for Main Profile only. Simple Profile is always disable, and not applicable to Advanced Profile. This field is used in both VLD and IT modes. This is derived by driver from the history of RANGERED and RANGEREDFRM syntax elements (i.e. of forward/preceding reference picture) and those of the current picture. RANGERED is the same as (bPicOverflowBlocks >> 3) & 1. RANGEREDFRM is the same as (bPicDeblocked >> 5) & 1. For the current picture is a B picture, this field represents the state of the forward/preceding reference picture onlyDriver is responsible to keep RangeReductionScale, RangeReduction Enable and RANGERED Present Flag of current picture coherent.

### 5 LOOPFILTER Enable Flag

This field is the decoded syntax element LOOPFILTER in bitstream. It indicates if In-loop Deblocking is ON according to picture level bitstream syntax control. This bit affects BSD unit and also the loop filter unit. When this bit is set to 1, PostDeblockOutEnable field in MFX\_PIPE\_MODE\_SELECT command must also be set to 1. In this case, in-loop deblocking operation follows the VC1 standard - deblocking doesn't cross slice boundary. When this bit is set to 0, but PostDeblockOutEnable field in MFX\_PIPE\_MODE\_SELECT command is set to 1. It indicates the loop filter unit is used for out-of-loop deblocking. In this case, deblocking operation does cross slice boundary. This field is used in VLD mode only, not in IT mode.

Value	Name	Description	Project
0h	Disable	Disables loop filter	All
1h	Enable	Enables loop filter	All

### 4 Overlap Smoothing Enable Flag

This field is the decoded syntax element OVERLAP in bitstream. Indicates if Overlap smoothing is ON at the picture level. This field is used in both VLD and IT modes.

Value	Name	Description	Project
0h	Disable	to disable overlap smoothing filter	All
1h	Enable	to enable overlap smoothing filter	All

## MFD\_VC1\_BSD\_OBJECT

<b>MFD_VC1_BSD_OBJECT</b>			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>The MFD_VC1_BSD_OBJECT command is the only primitive command for the VC1 Decoding Pipeline. The macroblock data portion of the bitstream is loaded as indirect data object. Before issuing a MFD_VC1_BSD_OBJECT command, all VC1 states of the MFD Engine need to be valid. Therefore the commands used to set these states need to have been issued prior to the issue of a MFD_VC1_BSD_OBJECT command. VC1 deblock filter kernel cross the slice boundary if in the last MB row of a slice, so need to know the last MB row of a slice to disable the edge mask. There is why VC1 BSD hardware need to know the end of MB address for the current slice. As such no more phantom slice is needed for VC1, as long as the driver will program both start MB address in the current slice and the start MB address of the next slice. As a result, we can also support multiple picture state commands in between slices.</p>

		Format:	MBZ		
	23:16	<b>Slice Start Vertical Position</b>			
		<p>This field specifies the position in y-direction of the first macroblock in the Slice in unit of macroblocks. For SecondField this value is reset to zero as oppoed to the VC1 spec Ref: 9.1.2 Slice Layer. This field is for both Long and Short VC1 Interface Format.</p>			
	15:9	<b>Reserved</b>			
Project:		All			

## MFD\_VC1\_BSD\_OBJECT

		Format:	MBZ
	8:0	<b>Next Slice Vertical Position</b> This field specifies the position in y-direction of the first macroblock in the next Slice in unit of macroblocks. This field is primarily used for error concealment. In the case that current slice is the last slice, this field should set to the height of picture (since y-direction is zero-based numbering) This field is maintained and provided by the driver for both Long and Short VC1 Interface Format.	
4	31:16	<b>First_MB_Byte_Offset of Slice Data or Slice Header</b> For DXVA2 VC1 Short Format only It gives the byte offset to locate the first MB data in the bitstream for a slice, relative to the Indirect BSD Data Start Address.	
	15:5	<b>Reserved</b>	
		Project:	All
	Format:	MBZ	
4	<b>Emulation Prevention Byte Present</b>		
	<b>Value</b>	<b>Name</b>	<b>Description</b>

	1h		H/W does not need to perform Emulation Byte Removal
3	<b>Reserved</b>		
	Project:	All	
Format:	MBZ		
2:0	<b>FirstMbBitOffset (First Macroblock Bit Offset )</b>		
	Format:	U3	
This field provides the bit offset of the first macroblock of the Slice in the first byte of the input compressed bitstream. It is used with First_MB_Byte_Offset for non-byte aligned position.			

## MFX\_MPEG2\_PIC\_STATE

MFX_MPEG2_PIC_STATE			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>This must be the very first command to issue after the surface state, the pipe select and base address setting commands. For MPEG-2 the encoder is called per slice-group, however the picture state is called per picture. Notice that a slice-group is a group of consecutive slices that no non-trivial slice headers are inserted in between.</p>

11	<b>TFF (Top Field First)</b> When two fields are stored in a picture, this bit indicates if the top field is the first field.For a frame P picture, the value 1 indicates that the top field of the reconstructed frame is the first field output by the decoding process, the same as defined in ISO/IEC 13818-2 6.3.10. Particularly, it is used by the hardware to calculate derivative motion vectors from the dual-prime motion vectors.For a field P picture, hardware uses this bit together with the Picture Structure to determine if the current picture is the Second Field. In this case, the definition of this bit differs from ISO/IEC 13818-2 6.3.10 - software must derive the value for this bit according to the following relation:Picture Structure = top fieldPicture Structure = bottom fieldSecond Field = 0TFF = 1TFF = 0Second Field = 1TFF = 0TFF = 1											
10	<b>Frame Prediction Frame DCT</b> This field provides constraints on the DCT type and prediction type. It affects the syntax of the bitstream.											
9	<b>Concealment Motion Vector Flag</b> This field indicates if the concealment motion vectors are coded in intra macroblocks. It affects the syntax of the bitstream.

## MFD\_MPEG2\_BSD\_OBJECT

<b>MFD_MPEG2_BSD_OBJECT</b>				
Project:	HSW			
Source:	VideoCS			
Length Bias:	2			
<p>Different from AVC and VC1, MFD_MPEG2_BSD_OBJECT command is pipelinable. This is for performance purpose as in MPEG2 a slice is defined as a group of MBs of any size that must be within a macroblock row. Slice header parameters are passed in as inline data and the bitstream data for the slice is passed in as indirect data. Of the inline data, slice_horizontal_position and slice_vertical_position determines the location within the destination picture of the first macroblock in the slice. The content in this command is identical to that in the MEDIA_OBJECT command in VLD mode described in the Media Chapter.</p>

## MFD\_MPEG2\_BSD\_OBJECT

		Project:	All
		Format:	U32
		<p>It is the length in bytes of the bitstream data for the current slice. It includes the first byte of the first macroblock and the last non-zero byte of the last macroblock in the slice. Specifically, the zero-padding bytes (if present) and the next start-code are excluded.</p> <p>This field is sized to support beyond MPEG-2 MP@HL bitstream (&lt;4K). According to Table 8-6 of ISO/IEC 13818-2, the maximum number of bits per macroblock for 4:2:0 is 4608. So the maximum slice size for 4K x 4K is <math>4608 * 256 / 8 = 147,456</math> bytes (0x24000), which requires 18 bits.</p>	
		<b>Programming Notes</b>	<b>Project</b>
		As MPEG-2 spec does not post any limitation of the size of zero-padding bytes, it is possible to have a slice data with large length (including zero-padding bytes). As the data beyond 0x10E00 would only be zero bytes for a valid slice data	
		zero-padding restriction is removed	DevHSW+
2	31:29	<b>Reserved</b>	
		Project:	All
		Format:	MBZ
	28:0	<p><b>Indirect Data Start Address</b></p> <p>This field specifies the Graphics Memory starting address of the data to be fetched into BSD Unit for processing. This pointer is relative to the BSD Indirect Object Base Address. Hardware ignores this field if indirect data is not present. It is a byte-aligned address for the MPEG2 VLD bitstream data. This address points to the first byte of the MB layer data, i.e. not including slice header.</p>	
3..4	31:0	<p><b>Inline Data</b></p> <p>All the required Slice Header parameters and error handling settings are captured as MPEG2_BSD_OBJECT Inline Data Descriptor structures. It has a fixed size of 2 DWs. Its definition is described in the next section.</p>	

## MFC\_MPEG2\_SLICEGROUP\_STATE

CV5	CV5	CV4	CV3	CV2	CV1	CV1	CV0

## MFC\_MPEG2\_PAK\_OBJECT

MFC_MPEG2_PAK_OBJECT			
Project:	HSW		
Source:	VideoCS		
Length Bias:	2		
<p>The MFC_MPEG2_PAK_OBJECT command is the second primitive command for the MPEG-2 Encoding Pipeline. Different from AVC, the MV Data portion of the bitstream is loaded as part of MB control data. Before issuing a MFC_MPEG2_PAK_OBJECT command, all MPEG2_MFX states need to be valid. Therefore the commands used to set these states need to have been issued prior to the issue of this command. MB record must be consecutive with no gaps, hence we do not need MB(x,y) in each MB command. Internal counter will keep track of the current MB address, starting from the Start_MB_In_Slice loaded at the beginning of each slice.</p> <p>MFC_MPEG2_PAK_OBJECT command follows the MbType definition like MFD. Many fields in this command are identical to that in VME output. This is intended to reduce software converting overhead from VME to PAK. Encoding statistical data such as the total size of the output bitstream are provided through MMIO registers. Software may access these registers through MI_STORE_REGISTER_MEM command.</p>

## VEBOX\_SURFACE\_STATE

<b>VEBOX_SURFACE_STATE</b>	
Project:	HSW
Source:	VideoEnhancementCS
Length Bias:	2
Description	Project
The input and output data containers accessed are called "surfaces". Surface state is sent to VEBOX via an inline state command rather than using binding tables. SURFACE_STATE contains the parameters defining each surface to be accessed, including its size, format, and offsets to its subsurfaces. The surface's base address is in the execution command. Despite having multiple input and output surfaces, we limit the number of surface states to one for input surfaces and one for output surfaces. The other surfaces are derived from the input/output surface states.	
The Current Frame Input surface uses the Input SURFACE_STATE	
The Previous Denoised Input surface uses the Input SURFACE_STATE. (For 12-bit Bayer pattern inputs this will be 8-bit.)	HSW
The Current Denoised Output surface uses the Input SURFACE_STATE. (For 12-bit Bayer pattern inputs this will be 8-bit.)	HSW
The STMM/Noise History Input surface uses the Input SURFACE_STATE with Tile-Y and Width/Height a multiple of 4.	
The STMM/Noise History Output surface uses the Input SURFACE_STATE with Tile-Y and Width/Height a multiple of 4.	
The Current Deinterlaced/IECP Frame Output surface uses the Output SURFACE_STATE.	
The Previous Deinterlaced/IECP Frame Output surface uses the Output SURFACE_STATE.	
The FMD per block output / per Frame Output surface uses the Linear SURFACE_STATE (see note below).	
The linear surface for FMD statistics is linear (not tiled). The height of the per block statistics is $(\text{Input Height} + 3) / 4$ - the Input Surface height in pixels is rounded up to the next even 4 and divided by 4. The width of the per block section in bytes is equal to the width of the Input Surface in pixels rounded up to the next 16 bytes. The pitch of the per block section in bytes is equal to the width of the Input Surface in pixels rounded up to the next 64 bytes.	
The STMM surfaces must be identical to the Input surface except for the tiling mode must be Tile-Y and the pitch must be legal for Tile-Y (increased to the next larger legal pitch). If the input surface is packed (Surface Format from 0 to 3 for DN/DI) then the pitch for the STMM surface is 1/2 the pitch of the input surface (rounded up to the next larger legal Tile-Y pitch). The width and height must be a multiple of 4 rounded up from the input height.	HSW
Programming Notes	
VEBOX may write to memory between the surface width and the surface pitch for output surfaces.

		Format:	U14		
		This field specifies the width of the surface in units of pixels. For PLANAR surface formats, this field indicates the width of the Y (luma) plane.			
		<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Exists If</b>
		[63,16383]		representing widths [64,16384]	
		[63,8191]			//Scalar Enabled
		[63,2047]			//Scalar and SFC Enabled
		<b>Programming Notes</b>			
		<p>The Width specified by this field multiplied by the pixel size in bytes must be less than or equal to the surface pitch (specified in bytes via the <b>Surface Pitch</b> field).</p> <p><b>Width</b> (field value + 1) must be a multiple of 2 for PLANAR_420, PLANAR_422, and all YCRCB_* surfaces, and must be a multiple of 4 for PLANAR_411 surfaces.</p> <p><b>VEBOX</b> supports a minimum width of 64</p>			
	3:0	<b>Reserved</b>			
		Format:	MBZ		
3	31:28	<b>Surface Format</b>			
		Project:	HSW		
		Format:	U4		
		Specifies the format of the surface. All of the Y and G channels will use table 0 and all of the Cr/Cb/R/B channels will use table 1.

1	First field; previous clean surface state is invalid									
<b>Programming Notes</b>										
If both DN and DI are disabled, this bit must be 0.										

## VEBOX\_STATE

	4	<b>DI Enable</b>	Format: Enable	
		Deinterlacer is bypassed if this is disabled: the output is the same as the input (same as a 2:2 cadence). FMD and STMM are not calculated and the values in the response message are 0.		
		<b>Value</b>	<b>Name</b>	
		0	Do not calculate DI	
	1	Calculate DI		
	3	<b>DN Enable</b>	Format: Enable	
		Denoise is bypassed if this is low - BNE is still calculated and output, but the denoised fields are not. VDI does not read in the denoised previous frame but uses the pointer for the original previous frame.		
		<b>Value</b>	<b>Name</b>	
		0	Do not denoise frame	
		1	Denoise frame	
<b>Programming Notes</b>				
If DN and/or Hotpixel are the only functions enabled then the only output is the Denoised Output which is the same surface format as the input. To get a format conversion with DN only, enable the Global IECP bit, but disable all the individual functions. The IECP output uses the output surface format.				
2	<b>Global IECP Enable</b>	Indicates if any of the IECP features is enabled. If this is disabled then no state will be read from any of the state pointers. If set then the IECP state will be read.		
	<b>ColorGamutCompressionEnable</b>	Indicates if the Gamut Compression feature is enabled. If set then the Gamut State will be read. VEB_VERTABLE_STATE is only needed if this bit is set.		
	<b>ColorGamutExpansionEnable</b>	Indicates if the Gamut Expansion feature is enabled. If set then the Gamut State will be read.		
2	31:12	<b>DN/DI State Pointer</b>	Format: GraphicsAddress[31:12]	
		Starting address of the DN/DI State buffer. This points to a buffer containing the 8 Dwords of the DN/DI state.		
	11:0	<b>Reserved</b>	Format: MBZ

<b>MFD_JPEG_BSD_OBJECT</b>		
		Format: MBZ
	25:0	<b>MCU Count</b>
		Project: All
		Format: U26
		This field indicates the number of MCUs in the Scan.
5	31:16	<b>Reserved</b>
		Project: All
		Format: MBZ
	15:0	<b>RestartInterval(16 bit)</b>
		Project: All
		Format: U16
		Specifies the number of MCU in restart interval. Valid values are 1->0xFFFF Value of 0 implies that all the SCAN have only one ECS.

## 3DSTATE\_CLEAR\_PARAMS

3DSTATE_CLEAR_PARAMS			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
This command defines the depth clear value delivered as a pipelined state command. However, the state change pipelining isn't completely transparent (see restriction below).			
Programming Notes		Project	
<b>Restriction:</b> Prior to changing Depth/Stencil Buffer state (i.e., any combination of 3DSTATE_DEPTH_BUFFER, 3DSTATE_CLEAR_PARAMS, 3DSTATE_STENCIL_BUFFER, 3DSTATE_HIER_DEPTH_BUFFER) SW must first issue a pipelined depth stall (PIPE_CONTROL with Depth Stall bit set), followed by a pipelined depth cache flush (PIPE_CONTROL with Depth Flush Bit set, followed by another pipelined depth stall (PIPE_CONTROL with Depth Stall Bit set), unless SW can otherwise guarantee that the pipeline from WM onwards is already flushed (e.g., via a preceding MI_FLUSH). If clear, the depth clear value is obtained from interpolated depth of an arbitrary pixel of the primitive rendered with <b>Depth Buffer Clear</b> set in WM_STATE or 3DSTATE_WM. If set, the depth clear value is obtained from the <b>Depth Clear Value</b> field of this command.</p>		Format:	Boolean	
Format:	Boolean				

## 3DSTATE\_DEPTH\_BUFFER

<b>3DSTATE_DEPTH_BUFFER</b>		
Project:	HSW	
Source:	RenderCS	
Length Bias:	2	
The depth buffer surface state is delivered as a pipelined state packet. However, the state change pipelining isn't completely transparent (see restriction below).		
Programming Notes		Project
Restriction: Prior to changing Depth/Stencil Buffer state (i.e., any combination of 3DSTATE_DEPTH_BUFFER, 3DSTATE_CLEAR_PARAMS, 3DSTATE_STENCIL_BUFFER, 3DSTATE_HIER_DEPTH_BUFFER) SW must first issue a pipelined depth stall (PIPE_CONTROL with Depth Stall bit set), followed by a pipelined depth cache flush (PIPE_CONTROL with Depth Flush Bit set, followed by another pipelined depth stall (PIPE_CONTROL with Depth Stall Bit set), unless SW can otherwise guarantee that the pipeline from WM onwards is already flushed (e.g., via a preceding MI_FLUSH).		
The depth buffer is always Tile-Y		HSW

## 3DSTATE\_DEPTH\_BUFFER

		This field defines the type of the surface.	
		<b>Value</b>	<b>Name</b>
		<b>Description</b>	
		0h	SURFTYPE_1D
		1h	SURFTYPE_2D
		2h	SURFTYPE_3D
		3h	SURFTYPE_CUBE
		4h-6h	Reserved
		7h	SURFTYPE_NULL
		<b>Programming Notes</b>	
		The <b>Surface Type</b> of the depth buffer must be the same as the <b>Surface Type</b> of the render target(s) (defined in SURFACE_STATE), unless either the depth buffer or render targets are SURFTYPE_NULL	
28	<b>Depth Write Enable</b>	Format:	Enable
		This field enables depth writes to the depth buffer surface. Both this field and the <b>Depth Buffer Write Enable</b> field in DEPTH_STENCIL_STATE must be enabled in order for depth writes to occur.	
27	<b>Stencil Write Enable</b>	Format:	Enable
		This field enables stencil writes to the depth buffer or stencil buffer surface, depending on where stencil is located. Both this field and the <b>Stencil Buffer Write Enable</b> field in DEPTH_STENCIL_STATE must be enabled in order for stencil writes to occur.	
26:23	<b>Reserved</b>	Format:	MBZ
22	<b>Hierarchical Depth Buffer Enable</b>	Format:	Enable
		If enabled, indicates that a hierarchical depth buffer is defined.	
		<b>Programming Notes</b>	
		If this field is enabled, the <b>Software Tiled Rendering Mode</b> must be NORMAL. This field must be disabled if <b>Early Depth Test Enable</b> is disabled.	
21	<b>Reserved</b>	Format:	MBZ
20:18	<b>Surface Format</b>	Specifies the format of the depth buffer. See <b>Stencil Test Enable</b> field in DEPTH_STENCIL_STATE field for restrictions on the use of some of these formats.	
		<b>Value</b>	<b>Name</b>
		<b>Description</b>

## 3DSTATE\_VERTEX\_BUFFERS

3DSTATE_VERTEX_BUFFERS			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
Description		Project	
This command is used to specify VB state used by the VF function.			
[DevHSW]: Can specify from 1 to 33 VBs.		HSW	
The VertexBufferID field within a VERTEX_BUFFER_STATE structure indicates the specific VB. If a VB definition is not included in this command, its associated state is left unchanged and is available for use if previously defined.			
Programming Notes			
It is possible to have individual vertex elements sourced completely from generated ID values and therefore not require any vertex buffer accesses for that vertex element. In this case, VF function will simply ignore the VB state associated with that vertex element. If all enabled vertex elements have this characteristic, no VBs are required to process 3DPRIMITIVE commands. For example, this might arise when the user wants to perform all data lookups in the first shader, so only generated index values need to be passed down to it. In this extreme case, SW would not need to program any VB state, and therefore not need to issue any 3DSTATE_VERTEX_BUFFERS commands.			
For any 3DSTATE_VERTEX_BUFFERS command, at least one VERTEX_BUFFER_STATE structure must be included.			
VERTEX_BUFFER_STATE structures are 4 DWords for both VERTEXDATA buffers and INSTANCEDATA buffers.			
Inclusion of partial VERTEX_BUFFER_STATE structures is UNDEFINED.			
The order in which VBs are defined within this command can be arbitrary, though a vertex buffer must be defined only once in any given command (otherwise operation is UNDEFINED).

## 3DSTATE\_VERTEX\_ELEMENTS

3DSTATE_VERTEX_ELEMENTS			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
Description		Project	
This is a variable-length command used to specify the active vertex elements. Each VERTEX_ELEMENT_STATE structure contains a Valid bit which determines which elements are used.		HSW	
[DevHSW]: Up to 34 elements.		HSW	
Programming Notes		Project	
[DevHSW]: At least one VERTEX_ELEMENT_STATE structure must be included.		HSW	
Inclusion of partial VERTEX_ELEMENT_STATE structures is UNDEFINED.			
[DevHSW]: SW must ensure that at least one vertex element is defined prior to issuing a 3DPRIMITIVE command, or operation is UNDEFINED.		HSW	
[DevHSW]: There are no 'holes' allowed in the destination vertex: NOSTORE components must be overwritten by subsequent components unless they are the trailing DWords of the vertex. Software must explicitly chose some value (probably 0) to be written into DWords that would otherwise be 'holes'.		HSW	
[DevHSW]: Within a VERTEX_ELEMENT_STATE structure, if a Component Control field is set to something other than VFCOMP_STORE_SRC, no higher-numbered Component Control fields may be set to VFCOMP_STORE_SRC. In other words, only trailing components can be set to something other than VFCOMP_STORE_SRC.		HSW	
[DevHSW]: See additional restrictions listed in the command fields and VERTEX_ELEMENT_STATE description.		HSW	
[DevHSW]: Element[0] must be valid.		HSW	
[DevHSW]: All elements must be valid from Element[0] to the last valid element. (I.e. if Element[2] is valid then Element[1] and Element[0] must also be valid).		HSW	
[DevHSW]: The pitch between elements packed in the URB will always be 128 bits.		HSW

## 3DSTATE\_INDEX\_BUFFER

3DSTATE_INDEX_BUFFER			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
<p>This command is used to specify the current IB state used by the VF function. At most one IB is defined and active at any given time.</p> <p>NOTES: The IB must be specified before any RANDOM 3D_PRIMITIVE commands are issued. It is possible to have vertex elements source completely from generated ID values and therefore not require any Index Buffer accesses. In this case, VF function will simply ignore the Index Buffer state.</p>			
DWord	Bit	Description	
0	31:29	<b>Command Type</b>	
		Default Value:	3h GFXPIPE
		Format:	OpCode
	28:27	<b>Command SubType</b>	
		Default Value:	3h GFXPIPE_3D

	Format:	MBZ	
9:8	<b>Index Format</b>		

## 3DSTATE\_INDEX\_BUFFER

<b>3DSTATE_INDEX_BUFFER</b>			
		Project: All	
		Format: U2 enumerated type	
	This field specifies the data format of the index buffer. All index values are UNSIGNED.		
	<b>Value</b>	<b>Name</b>	<b>Project</b>
	0h	INDEX_BYTE	All
	1h	INDEX_WORD	All
	2h	INDEX_DWORD	All
7:0	<b>DWord Length</b>		
	Default Value: 1h Excludes DWord (0,1)		
	Project: All		
	Format: =n Total Length - 2		
1	31:0	<b>Buffer Starting Address</b>	
		Project: All	
		Format: GraphicsAddress[31:0]Index_Buffer_Entry	
This field contains the size-aligned (as specified by Index Format) Graphics Address of the first element of interest within the index buffer. Software must program this value with the combination (sum) of the base address of the memory resource and the byte offset from the base address to the starting structure within the buffer.			
<b>Programming Notes</b>			
Index Buffers can only be allocated in linear (not tiled) graphics memory.			
2	31:0	<b>Buffer Ending Address</b>	
		Project: All	
		Format: GraphicsAddress[31:0]	
If non-zero, this field contains the address of the last valid byte in the index buffer. Any index buffer reads past this address returns an index value of 0 (as if the index buffer was zero-extended). Software must guarantee that the buffer ends on an index boundary (e.g., for an INDEX_DWORD buffer, Bits [1:0] == 11b).			
<b>Note:</b>		<b>Project</b>	
<b>Note:</b> Software needs to disable the index buffer by setting Index Buffer Start address AFTER Index Buffer End address for draws where the starting index location is greater than the index buffer size. Also the addresses cannot be in the same cache line to disable the index buffer.		HSW	
<b>Note:</b> Software needs to make the index buffer ending address on the last byte of a cacheline and fill in 0's for the added extra bytes of the cacheline.		HSW	

## 3DSTATE\_VF

3DSTATE_VF			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
This command is used to control:the use of Cut Index for the Index Buffer			
DWord	Bit	Description

	Project:	All	
	Format:	Enable	

## 3DSTATE\_VF

		<p>If ENABLED, vertex indices in RANDOM 3DPRIMITIVE commands are compared to the Cut Index (specified below). When the vertex index matches the Cut Index any previous topology is terminated. If DISABLED, vertex indices are not compared to the Cut Index and are used strictly as indices into vertex buffers. This field can only be enabled for certain primitive topology types. Refer to the table later in this section for details.</p>							
	7:0	<p><b>DWord Length</b></p> <table border="1"> <tr> <td>Default Value:</td> <td>0h Excludes DWord (0,1)</td> </tr> <tr> <td>Project:</td> <td>All</td> </tr> <tr> <td>Format:</td> <td>=n Total Length - 2</td> </tr> </table>		Default Value:	0h Excludes DWord (0,1)	Project:	All	Format:	=n Total Length - 2
Default Value:	0h Excludes DWord (0,1)								
Project:	All								
Format:	=n Total Length - 2								
1	31:0	<p><b>Cut Index</b></p> <table border="1"> <tr> <td>Project:</td> <td>All</td> </tr> </table> <p>This field specifies the index value that is considered the "cut index" which vertex indices are compared to if a Cut Index Enable is set. The Cut Index is compared to the fetched (and possibly-sign-extended) vertex index, and if these values are equal, the current primitive topology is terminated. Note that, for index buffers &lt;32bpp, it is possible to set the Cut Index to a (large) value that will never match a sign-extended vertex index.</p>		Project:	All				
Project:	All								

## 3DSTATE\_CC\_STATE\_POINTERS

<b>3DSTATE_CC_STATE_POINTERS</b>			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
The 3DSTATE_CC_STATE_POINTERS command is used to set up the pointers to the color calculator state.			
Programming Notes			
When the CC_STATE pointer changes but not the BLEND_STATE pointer, driver needs to force a BLEND_STATE pointer change in order to improve blend performance in the pixel backend.

		Format:	MBZ
	7	<b>Software Exception Enable</b>	
		Format:	Enable
		This bit gets loaded into EU CR0.1[13] (note the bit # difference). See Exceptions and ISA Execution Environment. This field is ignored if VS Function Enable is DISABLED.	
	6:0	<b>Reserved</b>	
		Format:	MBZ
3	31:10	<b>Scratch Space Base Offset</b>	
		Project:	All
		Format:	GeneralStateOffset[31:10]ScratchSpace
		Specifies the starting location of the scratch space area allocated to this FF unit as a 1K-byte aligned offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space. The computed offset of the thread-specific portion will be passed in the thread payload as Scratch Space Offset. The thread is expected to utilize "stateless" DataPort read/write requests to access scratch space, where the DataPort will cause the General State Base Address to be added to the offset passed in the request header. This field is ignored if VS Function Enable is DISABLED.	
	9:4	<b>Reserved</b>	
		Project:	All
		Format:	MBZ
	3:0	<b>Per-Thread Scratch Space</b>	
		Project:	All
		Format:	U4 power of 2 Bytes over 1K Bytes
		Specifies the amount of scratch space to be allocated to each thread spawned by this FF unit. The driver must allocate enough contiguous scratch space, starting at the Scratch Space Base Pointer, to ensure that the Maximum Number of Threads can each get Per-Thread Scratch Space size without exceeding the driver-allocated scratch space. This field is ignored if VS Function

	Format:	=n	
1	31:6	<b>Kernel Start Pointer</b>	
		Project:	All
		Format:	InstructionBaseOffset[31:6]Kernel
	This field specifies the starting location (1st GEN4 core instruction) of the kernel program run by threads spawned by this FF unit. It is specified as a 64-byte-granular offset from the Instruction Base Address.		
5:0	<b>Reserved</b>		
	Project:	All	
	Format:	MBZ	

## 3DSTATE\_GS

2	31	<b>Single Program Flow (SPF)</b>	
	Project:		All
	Specifies the initial condition of the kernel program as either a single program flow (SIMDn <sub>xm</sub> with m = 1) or as multiple program flows (SIMDn <sub>xm</sub> with m > 1). See CR0 description in ISA Execution Environment.		
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	0h	Disable	Single Program Flow disabled
	1h	Enable	Single Program Flow enabled
	30	<b>Vector Mask Enable (VME)</b>	
	Project:		All
	Format:		U1 enumerated type
	When SPF=0, VME specifies which mask to use to initialize the initial channel enables. When SPF=1, VME specifies which mask to use to generate execution channel enables.		
<b>Value</b>	<b>Name</b>	<b>Description</b>	
0h	Dmask	Channels are enabled based on the dispatch mask	
1h	Vmask	Channels are enabled based on the vector mask	
29:27	<b>Sampler Count</b>		
Project:		All	
Format:		U3	
Specifies how many samplers (in multiples of 4) the geometry shader kernel uses. Used only for prefetching the associated sampler state entries.			
<b>Value</b>	<b>Name</b>	<b>Description</b>	
0h	No Samplers	no samplers used	
1h	1-4 Samplers	between 1 and 4 samplers used	
2h	5-8 Samplers	between 5 and 8 samplers used	
3h	9-12 Samplers	between 9 and 12 samplers used	
4h	13-16 Samplers	between 13 and 16 samplers used

	5:0	<b>Reserved</b>	Project: HSW	Format: MBZ		
	3	31:10	<b>Scratch Space Base Pointer</b>	Project: All	Format: GeneralStateOffset[31:10]	Specifies the location of the scratch space area allocated to this FF unit, specified as a 1KB-granular offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space.
		9:4	<b>Reserved</b>	Project: All	Format: MBZ	
		3:0	<b>Per-Thread Scratch Space</b>	Project: All	Format: U4 Power of 2 Bytes over 1K Bytes	Specifies the amount of scratch space to be allocated to each thread spawned by this FF unit. The driver must allocate enough contiguous scratch space, starting at the Scratch Space Base Pointer, to ensure that the Maximum Number of Threads can each get Per-Thread Scratch Space size without exceeding the driver-allocated scratch space.

		<b>3DSTATE_GS</b>		
		<b>Value</b>	<b>Name</b>	
		[0,11]	indicating [1K Bytes, 2M Bytes]	
4	31:29	<b>Reserved</b>		
		Project:	All	
		Format:	MBZ	
	28:23	<b>Output Vertex Size</b>		
	Project:	All		
	Format:	U6		
		[0,62] indicating [1,63] 16B units		
		Specifies the size of each vertex stored in the GS output entry (following any Control Header data) as a number of 128-bit units (minus one).		
		<b>Programming Notes</b>		
		Programming Restrictions: The vertex size must be programmed as a multiple of 32B units with the following exception: Rendering is disabled (as per SOL stage state) and the vertex size output by the GS thread is 16B. If rendering is enabled (as per SOL state) the vertex size must be programmed as a multiple of 32B units. In other words, the only time software can program a vertex size with an odd number of 16B units is when rendering is disabled.		
	22:17	<b>Output Topology</b>		
		Project:	All	
		Format:	3DPrimType	
		This field specifies the topology type (3DPrimType) to be associated with GS-thread output vertices (if any).		
	16:11	<b>Vertex URB Entry Read Length</b>		
		Project:	All	
			Specifies the amount of URB data read and passed in the thread payload for each Vertex URB entry, in 256-bit register increments.	
			<b>Programming Notes</b>	
		Programming Restriction: This field must be a non-zero value if Include Vertex Handles is cleared to zero.		
10	<b>Include Vertex Handles</b>			
		Project:	All	
		Format:	Boolean	
	If set, all the input Vertex URB handles are included in the payload. These are referred to as "pull model" URB handles, as the thread will use them to read from the URB.			
		<b>Programming Notes</b>	<b>Project</b>	

## 3DSTATE\_GS

		<p>This field must be set if Vertex URB Entry Read Length is cleared to zero.</p> <p>When this field is set and GS is enabled, only PATCHLIST topologies may be submitted. I.e., pull-model vertices are only supported for PATCH objects, other object types must completely push all vertex data into the payload.</p> <p>This field must be set when the input topology is a Patchlist with more than 4 ICP's.</p>														
	9:4	<b>Vertex URB Entry Read Offset</b> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 20%;">Project:</td> <td>All</td> </tr> <tr> <td>Double Buffer Armed By:</td> <td>Specifies the offset (in 256-bit units) at which Vertex URB data is to be read from the URB before being included in the thread payload. Project:	All															
Format:	U4															

## 3DSTATE\_GS

The value 0 indicates there is no control data header, and Control Data Format is ignored. Software must ensure that the Control Data Header Size is sufficient to accommodate the maximum number of vertices output by the GS thread. It is UNDEFINED for a GS thread to report more output vertices than can be accommodated in a non-zero-sized header. (If the header size is zero, by definition neither cut nor StreamID bits are defined.)

Value	Name
[0,8]	32B units

Programming Notes	Project
If this field is a non-zero value, then the URB allocation for the geometry shader must be in the lower 256KB of the URB.	DevHSW:GT2:A0, DevHSW:GT3:A0

19:15	<p><b>Instance Control</b></p> <table border="1"> <tr> <td>Project:</td> <td>All</td> </tr> <tr> <td>Format:</td> <td>U5-1 in #instances</td> </tr> </table> <p>[0,31] indicating [1,32] instances</p> <p>Specifies the number of instances (minus one) for each input object. To avoid confusion, this document uses the term "InstanceCount" to refer to InstanceControl+1, with a range of [1,32]. If InstanceCount&gt;1, DUAL_OBJECT mode is invalid. Software will likely want to use DUAL_INSTANCE mode for higher performance, but SINGLE mode is also supported. When InstanceCount=1 (one instance per object) software can decide which dispatch mode to use. DUAL_OBJECT mode would likely be the best choice for performance, followed by SINGLE mode. DUAL_INSTANCE mode is not recommended but is supported.</p>	Project:	All	Format:	U5-1 in #instances

0h	SINGLE	Each thread shades a single instance of one object.												
1h	DUAL_INSTANCE	Each thread shades possibly two instances of one object. If the InstanceCount is odd, a trailing dispatch of only one instance will be made for each object received. Not recommended if InstanceCount = 1, assuming a kernel optimized for SINGLE or DUAL_OBJECT dispatch												

## 3DSTATE\_GS

			<p>would outperform a kernel compiled for DUAL_INSTANCE but only passed one instance. The GS must be allocated at least two URB handles or behavior is UNDEFINED.</p>
	2h	DUAL_OBJECT	<p>Each thread shades one instance of possibly two objects. The GS unit attempt to pair objects together into one dispatch, but under some circumstances only one object may be dispatched (as controlled by the DispatchMask generated by the GS unit). Not valid for objects with more than 16 vertices per object. Not valid if InstanceCount &gt; 1 (more than one instance per object). The GS must be allocated at least two URB handles or behavior is UNDEFINED.</p>
	3h	Reserved	
		<b>Programming Notes</b>	<b>Project</b>
		The Dispatch Mode must be set to 0h (SINGLE) when executing TRILIST_ADJ or TRISTRIP_ADJ as an input topology.	DevHSW:GT2:A, DevHSW:GT2:B, DevHSW:GT3:A, DevHSW:GT3:B
10	<b>GS Statistics Enable</b>		
	Project:		All
This bit controls whether GS-unit-specific statistics register(s) can be incremented.			
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	0h	Disable	GS_INVOCATIONS_COUNT and GS_PRIMITIVES_COUNT cannot increment
	1h	Enable	GS_INVOCATIONS_COUNT and GS_PRIMITIVES_COUNT can increment
9:5	<b>GS Invocations Increment Value</b>		
	Project:		All
	Format:		U5
<p>Specifies how much to increment the GS_INVOCATIONS_COUNT for each instance of each object. This control is provided to allow software to process multiple instances (from an API POV) in a single kernel invocation. In SINGLE dispatch mode, the counter will increment by this value for each dispatch (as it's only one instance of one object). In DUAL_INSTANCE mode, the counter will be incremented by the value if only one instance is included in the dispatch (i.e., the last odd instance), otherwise the counter will be incremented by twice this value. In DUAL_OBJECT dispatch mode, the counter will be incremented by the value if only one object is included in the dispatch (i.e., a forced dispatch of one object), otherwise the counter will be incremented by twice this value.</p>			
	<b>Value</b>	<b>Name</b>	
	[0,31]	indicating an increment of [1,32]	
4	<b>Include Primitive ID</b>		
	Project:		All
	Format:		Boolean
If set, R1 of the payload is written with Primitive ID value(s). If clear, these Primitive ID values are

## 3DSTATE\_GS

		<p>primitive when operating with a GS kernel that expects the without-adjacency variant of the object. (E.g., when the GS kernel is compiled to expect a TRIANGLE object, software should set this bit just in case a TRILIST_ADJ is submitted to the pipeline.) Note that the GS unit is otherwise not aware of the object type that is expected by the GS kernel. It is up to software to ensure that the submitted primitive type (in 3DPRIMITIVE) is otherwise compatible with the object type expected by the GS kernel. (E.g., if the GS kernel expects a LINE_ADJ object, only LINELIST_ADJ or LINESTRIP_ADJ should be submitted, otherwise the GS kernel will produce unpredictable results.) Also note that it is possible to craft a GS kernel which can accept any object type that's thrown at it by first examining the PrimType passed in the payload and then using this info to correctly interpret the number of vertices passed in the payload.</p>

		Project:			All
		Format:			Enable
		This field is used to control whether the Viewport X,Y extents are considered in VertexClipTest. See Tristrip Clipping Errata subsection.			
	27	<b>Viewport Z ClipTest Enable</b>			
		Project:			All
		Format:			Enable
		This field is used to control whether the Viewport Z extents (near, far) are considered in VertexClipTest.			

## 3DSTATE\_CLIP

		<b>3DSTATE_CLIP</b>	
26	<b>Guardband ClipTest Enable</b>		
	Project:	All	
	Format:	Enable	
	<p>This field is used to control whether the Guardband X,Y extents are considered in VertexClipTest for non-point objects. If the Guardband ClipTest is DISABLED but the Viewport XY ClipTest is ENABLED, ClipDetermination operates as if the Guardband were coincident with the Viewport. If both the Guardband and Viewport XY ClipTest are DISABLED, all vertices are considered "visible" with respect to the XY directions.</p>		
25:24	<b>Reserved</b>		
	Project:	All	
	Format:	MBZ	
23:16	<b>User Clip Distance Clip Test Enable Bitmask</b>		
	Project:	All	
	Format:	Enable[8]	
	<p>This 8 bit mask field selects which of the 8 user clip distances against which trivial reject / trivial accept / must clip determination needs to be made. DX10 allows simultaneous use of ClipDistance and Cull Distance test of up to 8 distances.</p>		
15:13	<b>Clip Mode</b>		
	Project:	All	
	<p>This field specifies a general mode of the CLIP unit, when the CLIP unit is ENABLED.</p>		
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	0h	CLIPMODE_NORMAL	TrivialAccept objects are passed down the pipeline, MustClip objects Clipped in the Fixed Function Clipper HW, TrivialReject and BAD objects are discarded
	1h	Reserved	
	2h	Reserved	
	3h	CLIPMODE_REJECT_ALL	All objects are discarded
	4h	CLIPMODE_ACCEPT_ALL	All objects (except BAD objects) are trivially accepted. This effectively disables the clip-test/clip-determination function. Note that the CLIP unit will still filter out adjacency information, which may be required since the SF unit does not accept primitives with adjacency.
	5h-7h	Reserved	
12:10	<b>Reserved</b>		

## 3DSTATE\_CLIP

	Project:	All
	Format:	MBZ
9	<b>Perspective Divide Disable</b>	
	Project:	All
	Format:	Disable
	<p>This field disables the Perspective Divide function performed on homogeneous position read from the URB. This feature can be used by software to submit pre-transformed "screen-space" geometry for rasterization. This likely requires the W component of positions to contain "rhw" (aka 1/w) in order to support perspective-correct interpolation of vertex attributes. Likewise, the X,Y,Z components will likely be required to be X/W, Y/W, Z/W. Note that the device does not support clipping when perspective divide is disabled. Software must specify CLIPMODE_ACCEPT_ALL whenever it disables perspective divide. This implies that software must ensure that object positions are completely contained within the "guardband" screen-space limits imposed by the SF unit (e.g., by clipping in CPU SW before submitting the objects).</p>	
8	<b>Non-Perspective Barycentric Enable</b>	
	Project:	All
	Format:	Enable
	<p>This field enables computation of non-perspective barycentric parameters in the clipper, which are sent to SF unit in the must clip case. This field must be enabled if any non-perspective barycentric parameters are enabled in the Windower.</p>

11	<b>Legacy Global Depth Bias Enable</b>			
	Project:		All	
	Format:		Enable	
	Enables the SF to use the Global Depth Offset Constant state unmodified. If this bit is not set, the SF will scale the Global Depth Offset Constant as described in section Error! Reference source not found. of this document.			
	<b>Programming Notes</b>			
	This bit should be set whenever non zero depth bias (Slope, Bias) values are used. Setting this bit may have some degradation of performance for some workloads.			
10	<b>Statistics Enable</b>			
	Project:		All	
	Format:		Enable	
	If ENABLED, this FF unit will increment CL_PRIMITIVES_COUNT on behalf of the CLIP stage. If DISABLED, CL_PRIMITIVES_COUNT will be left unchanged.			
	<b>Programming Notes</b>			
	This bit should be set whenever clipping is enabled and the Statistics Enable bit is set in CLIP_STATE. It should be cleared if clipping is disabled or Statistics Enable in CLIP_STATE is clear.			
9	<b>Global Depth Offset Enable Solid</b>			
	Project:		All	
	Format:		Enable	
	Enables computation and application of Global Depth Offset for SOLID objects.			
	<b>Programming Notes</b>			
	This bit should be set whenever non zero depth bias (Slope, Bias) values are used. Setting this bit may have some degradation of performance for some workloads.			
8	<b>Global Depth Offset Enable Wireframe</b>			
	Project:		All	
	Format:		Enable	
	Enables computation and application of Global Depth Offset when triangles are rendered in WIREFRAME mode.			

## 3DSTATE\_SF

3DSTATE_SF				
		<b>Programming Notes</b>		
		This bit should be set whenever non zero depth bias (Slope, Bias) values are used. Setting this bit may have some degradation of performance for some workloads.		
7	<b>Global Depth Offset Enable Point</b>			
	Project:	All		
	Format:	Enable		
	Enables computation and application of Global Depth Offset when triangles are rendered in POINT mode.			
	<b>Programming Notes</b>			
	This bit should be set whenever non zero depth bias (Slope, Bias) values are used. Setting this bit may have some degradation of performance for some workloads.			
6:5	<b>FrontFace Fill Mode</b>			
	Project:	All		
	Format:	U2 enumerated type		
	This state controls how front-facing triangle and rectangle objects are rendered.			
	<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>
	0h	SOLID	Any triangle or rectangle object found to be front-facing is rendered as a solid object. This setting is required when rendering rectangle (RECTLIST) objects.	All
	1h	WIREFRAME	Any triangle object found to be front-facing is rendered as a series of lines along the triangle boundaries (as determined by the topology type and controlled by the vertex EdgeFlags).	All
	2h	POINT	Any triangle object found to be front-facing is rendered as a set of point primitives at the triangle vertices (as determined by the topology type and controlled by the vertex EdgeFlags).NOTE: If the triangle is clipped, points will not be rendered at clip-inserted vertices. Point will only be rendered at original vertices (if visible).	
	3h	Reserved		
4:3	<b>BackFace Fill Mode</b>			
	Project:	All		
	Format:	U2 enumerated type		
	This state controls how back-facing triangle and rectangle objects are rendered.			
	<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>
	0h	SOLID	Any triangle or rectangle object found to be back-facing is rendered as a solid object. This setting is required when rendering rectangle (RECTLIST) objects.	All
	1h	WIREFRAME	Any triangle object found to be back-facing is rendered as a series of lines along the triangle boundaries (as determined by the topology type and controlled by the vertex EdgeFlags).	All

## 3DSTATE\_SF

		2h	POINT	Any triangle object found to be back-facing is rendered as a set of point primitives at the triangle vertices (as determined by the topology type and controlled by the vertex EdgeFlags).NOTE: If the triangle is clipped, points will not be rendered at clip-inserted vertices. Point will only be rendered at original vertices (if visible).	
		3h	Reserved		
	2	<b>Reserved</b>			
		Project:		All

	Project:	All	
	Format:	Enable	
	If ENABLED, the Windower and pixel pipeline will engage in statistics gathering. If DISABLED, statistics information associated with this FF stage will be left unchanged. See Statistics Gathering.		
1	30	<b>Depth Buffer Clear</b>	

## 3DSTATE\_WM

Project:	All
Format:	Enable

When set, the depth buffer is initialized as a side-effect of rendering pixels.

### Programming Notes

If this field is enabled,

2. **the Depth Test Enable** field in DEPTH\_STENCIL\_STATE must be disabled.
3. 3DSTATE\_DEPTH\_BUFFER::Depth Write Enable must be set.
4. 3DSTATE\_DEPTH\_BUFFER::Stencil Write Enable must be set if 3DSTATE\_STENCIL\_BUFFER::Stencil buffer enable is set. Additionally the following must be set to the correct values.

2. DEPTH\_STENCIL\_STATE::Stencil Write Mask must be 0xFF
3. DEPTH\_STENCIL\_STATE::Stencil Test Mask must be 0xFF
4. DEPTH\_STENCIL\_STATE::Back Face Stencil Write Mask must be 0xFF
5. DEPTH\_STENCIL\_STATE::Back Face Stencil Test Mask must be 0xFF

Refer to section 0 "Depth Buffer Clear" for additional restrictions when this field is enabled. If this field is enabled, **Pixel Shader Kill Pixel** must be disabled.

29 **Thread Dispatch Enable**

Project:	All
Format:	Enable

This bit, if set, indicates that it is possible for a PS thread to modify a render target, i.e., at least one render target is enabled (is not of type SURFTYPE\_NULL and has at least one channel enabled for writes) and the PS kernel contains a code path that may issue a write to that/those enabled RTs.

### Programming Notes

This bit is used for performance optimizations and does not directly control writing to render targets. If this bit is DISABLED, no pixel shader threads will be dispatched. For correct behavior, this bit must be set consistently with the behavior of the PS kernel, i.e. if this bit is DISABLED the PS kernel must not write color or depth to any render targets. If this field is disabled, **Pixel Shader Kill Pixel** must be disabled.

## 3DSTATE\_WM

28

### Depth Buffer Resolve Enable

Project:	All
Format:	Enable

When set, the depth buffer is made to be consistent with the hierarchical depth buffer as a side-effect of rendering pixels. This is intended to be used when the depth buffer is to be used as a surface outside of the 3D rendering operation.

#### Programming Notes

If this field is enabled,

2. the **Depth Buffer Clear** and **Hierarchical Depth Buffer Resolve Enable** fields must both be disabled.
3. 3DSTATE\_DEPTH\_BUFFER::Depth Write Enable must be set.

Refer to section 11.5.4.2 "Depth Buffer Resolve" for additional restrictions when this field is enabled. If **Hierarchical Depth Buffer Enable** is disabled, enabling this field will have no effect.

27

### Hierarchical Depth Buffer Resolve Enable

Project:	All
Format:	Enable

When set, the hierarchical depth buffer is made to be consistent with the depth buffer as a side-effect of rendering pixels. This is intended to be used when the depth buffer has been modified outside of the 3D rendering operation.

#### Programming Notes

**Project**

If this field is enabled,

2. the **Depth Buffer Clear** and **Depth Buffer Resolve Enable** fields must both be disabled.
3. 3DSTATE\_DEPTH\_BUFFER::Depth Write Enable must be set.

Refer to section 11.5.4.3 "Hierarchical Depth Buffer Resolve" for additional restrictions when this field is enabled.

If **Hierarchical Depth Buffer Enable** is disabled, enabling this field will have no effect.

**Performance Note:** expect the hierarchical depth buffer's impact on performance to be reduced for some period of time after this operation is performed, as the hierarchical depth buffer is initialized to a state that makes it ineffective. Further rendering will tend to bring the hierarchical depth buffer back to a more effective state.

## 3DSTATE\_WM

		Software needs to do an ambiguate after allocating the surface for the first time if the depth buffer width and height are NOT aligned to 8 and 4 respectively.	HSW
		Software needs to align the Depth buffer width to a mutiple of 8 and height to a mutiple of 4 while doing the HZ buffer resolve.	HSW
26	<b>Legacy Diamond Line Rasterization</b>		
	Project:	All	
	Format:	Enable	
	This bit, if ENABLED, indicates that the Windower will rasterize zero width lines using the DX9 rasterization rules. If DISABLED, the Windower will rasterize zero width lines using the DX10 rasterization rules (see Strips Fans chapter).		
25	<b>Pixel Shader Kill Pixel</b>		
	Project:	All	
	Format:	Enable	
	This bit, if ENABLED, indicates that the PS kernel or color calculator has the ability to kill (discard) pixels or samples, other than due to depth or stencil testing. This bit is required to be ENABLED in the following situations:		
	<ul style="list-style-type: none"> <li>• The API pixel shader program contains "killpix" or "discard" instructions, or other code in the pixel shader kernel that can cause the final pixel mask to differ from the pixel mask received on dispatch.</li> <li>• A sampler with chroma key enabled with kill pixel mode is used by the pixel shader.</li> <li>• Any render target has <b>Alpha Test Enable</b> or <b>AlphaToCoverage Enable</b> enabled.</li> <li>• The pixel shader kernel generates and outputs oMask.</li> </ul>		
	Note: As ClipDistance clipping is fully supported in hardware and therefore not via PS instructions, there should be no need to ENABLE this bit <u>due to ClipDistance clipping</u> .		
24:23	<b>Pixel Shader Computed Depth Mode</b>		
	Project:	HSW	
	Format:	U2 Enumerated Type	
	This field specifies the computed depth mode for the pixel shader.		
	<b>Value</b>	<b>Name</b>	<b>Description</b>
			<b>Project</b>

## 3DSTATE\_WM

	0h	PSCDEPTH_OFF	Pixel shader does not compute depth	All
	1h	PSCDEPTH_ON	Pixel shader computes depth with no guarantee as to its value	All
	2h	PSCDEPTH_ON_GE	Pixel shader computes depth and guarantees that oDepth >= SourceDepth	All
	3h	PSCDEPTH_ON_LE	Pixel shader computes depth and guarantees that oDepth <= SourceDepth	All
<b>Programming Notes</b>				
When bit 5 is set in WM_STATE(i.e. RT independent rasterization is enabled), this field can not be programmed to values: 2h or 3h.				
22:21	<b>Early Depth/Stencil Control</b>			
	Project:	HSW		
	Format:	U2 Enumerated Type		
This field specifies the behavior of early depth/stencil test.				
	<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>
	0h	EDSC_NORMAL	Depth/Stencil Test/Write behaves as if it happens post-shader, however the pixel shader is not necessarily executed if the pixel fails depth or stencil test (this is the legacy behavior)	All
	1h	EDSC_PSEXEC	Depth/Stencil Test/Write behaves as if it happens post-shader, and the pixel shader is executed if the pixel fails depth or stencil test (although pre-shader actions such as primitive inclusion, stipple, etc. will still cause the shader not to execute)	All
	2h	EDSC_PREPS	Depth/Stencil Test/Write behaves as if it happens pre-shader. The pixel shader is not executed if the pixel fails depth or stencil test. Depth and stencil writes occur even if the pixel is killed by the shader or post-shader by alpha test, etc. Depth output by the pixel shader is ignored.	All
	3h	Reserved		All
<b>Programming Notes</b>				
If EDSC_PSEXEC mode is selected, <b>Thread Dispatch Enable</b> must be set.				
20	<b>Pixel Shader Uses Source Depth</b>			
	Project:	All		
	Format:	Enable		
This bit, if ENABLED, indicates that the PS kernel requires the source depth value (vPos.z) to be passed in the payload. The source depth value is interpolated according to the Position ZW Interpolation Mode state.				
19	<b>Pixel Shader Uses Source W</b>			

## 3DSTATE\_WM

		Project:	All
		Format:	Enable
	<p>This bit, if ENABLED, indicates that the PS kernel requires the interpolated source W value (vPos.w) to be passed in the payload. The W value is interpolated according to the Position ZW Interpolation Mode state.</p>		
18:17	<p><b>Position ZW Interpolation Mode</b></p>		
	Project:	All	
	Format:	U2 Enumerated Type	
	<p>This field elects "interpolation mode" associated with the Position Z (source depth) and W coordinates passed in the PS payload when the PS requires Position as input. This field does not determine whether these coordinates are actually included in the payload (see Pixel Shader Requires Depth, Pixel Shader Requires W).</p>		
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	0h	INTERP_PIXEL	Evaluate Z & W at the pixel center or UL corner (as specified by Pixel Location of 3DSTATE_MULTISAMPLE)
	1h	Reserved	
	2h	INTERP_CENTROID	
	3h	INTERP_SAMPLE	
	<b>Programming Notes</b>		
	<p>When bit 5 is set in WM_STATE, value of 3h is not defined for this field.            Programming Note: When bit 5 in dword 1 (RT Independent Rasterization Enable) is set and bit 30 in dword 2 (PS UAV-only) is not set in WM_STATE, value of 3h is not defined for this field.</p>		
16:11	<p><b>Barycentric Interpolation Mode</b></p>		
	Project:	All	
	Format:	Enable[6]	
	<p>Controls which barycentric interpolation terms must be passed into the pixel shader kernel.            Bit 0: Perspective Pixel Location barycentric is required            Bit 1: Perspective Centroid barycentric is required            Bit 2: Perspective Sample barycentric is required            Bit 3: Non-perspective Pixel Location barycentric is required            Bit 4: Non-perspective Centroid barycentric is required            Bit 5: Non-perspective Sample barycentric is required</p>		
	<b>Programming Notes</b>		<b>Project</b>
	<p>If contiguous dispatch modes are enabled, only bit 3 (non-perspective pixel location) can be set, all other bits in this field must be zero. Pixel Location below refers to either the upper left corner or pixel center depending on the <b>Pixel Location</b> state of 3DSTATE_MULTISAMPLING). MSDISPMODE_PERSAMPLE is required in order to select Perspective Sample or Non-perspective Sample barycentric coordinates.</p>		

## 3DSTATE\_WM

		When Centroid Barycentric mode is required, HW may produce incorrect interpolation results when a 2X2 pixels have unlit pixels.	
		When RT Independent Rasterization Enable(bit 5) is set, Centroid Barycentric may produce incorrect results for NUM_RASTSAMPLES_2 and NUM_RASTSAMPLES_16.	HSW
10	<b>Pixel Shader Uses Input Coverage Mask</b>		
	Project:	All	
	Format:	Enable	
	This bit, if ENABLED, indicates that the PS kernel requires the input coverage mask to be passed in the payload.		
9:8	<b>Line End Cap Antialiasing Region Width</b>		
	Project:	All	
	Format:	U2	
	This field specifies the distances over which the coverage of anti-aliased line end caps are computed.		
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	0h		0.5 pixels
	1h		1.0 pixels
	2h		2.0 pixels
	3h		4.0 pixels
7:6	<b>Line Antialiasing Region Width</b>		
	Project:	All	
	Format:	U2	
	This field specifies the distance over which the anti-aliased line coverage is computed.		
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	0h		0.5 pixels
	1h		1.0 pixels
	2h		2.0 pixels
	3h		4.0 pixels
5	<b>RT Independent Rasterization Enable</b>		
	Project:	DevHSW+	
	Format:	Enable	
	Enables Render Target Independent Rasterization. Essentially hardware must use 3DSTATE_RAST_MULTISAMPLE state data for computing coverage masks. If this bit is disabled, 3DSTATE_MULTISAMPLE state data is used for coverage mask computation. When this bit is set, depth test/write and stencil test/write must be disabled in the Depth-Stencil state.		
	<b>Note:</b>		<b>Project</b>
	<b>Note:</b> This feature is NOT SUPPORTED and therefore this bit must not be set.		DevHSW:GT3:A0

## 3DSTATE\_WM

4	<b>Polygon Stipple Enable</b>	Project:	All	
		Format:	Enable	
Enables the Polygon Stipple function.				
3	<b>Line Stipple Enable</b>	Project:	All	
		Format:	Enable	
Enables the Line Stipple function.				
2	<b>Point Rasterization Rule</b>	Project:	All	
		Format:	3D_RasterizationRule	
This field specifies the rasterization rules to be applied whenever the edges of a point primitive fall exactly on a pixel sampling point.				
	<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>
	0h	RASTRULE_UPPER_LEFT	To match "normal" upper left rules for surface primitives	All
	1h	RASTRULE_UPPER_RIGHT	To match OpenGL point rasterization rules (round to + infinity, where this is the upper right direction wrt OpenGL screen origin of lower left).	All
1:0	<b>Multisample Rasterization Mode</b>	Project:	All	
		Format:	U2 enumerated type	
This field determines whether multisample rasterization is turned on/off, and how the pixel sample point(s) are defined. Software sets this according to the API, the API's multisample enable state setting (if any), and whether 1X or 4X MSRTs are bound. This state is duplicated in 3DSTATE_SF and both must be set to the same value. Refer to the "Multisampling" section for details on the settings of this field.				
	<b>Value</b>	<b>Name</b>	<b>Project</b>	
	0h	MSRASTMODE_OFF_PIXEL	All	
	1h	MSRASTMODE_OFF_PATTERN	All	
	2h	MSRASTMODE_ON_PIXEL	All	
	3h	MSRASTMODE_ON_PATTERN	All	
<b>Programming Notes</b>			<b>Project</b>	
When <b>Number of Multisamples</b> == NUMSAMPLES_1 and <b>RTIR is disabled</b> , this field must not be set to MSRASTMODE_xxx_PATTERN.			HSW	
When <b>Number of Rast Multisamples</b> == NUMSAMPLES_1 and <b>RTIR is enabled</b> , this				

## 3DSTATE\_WM

		field must not be set to MSRASTMODE_xxx_PATTERN.			
2	31	<b>Multisample Dispatch Mode</b>			
		Project:	All		
		Format:	U1 Enumerated Type		
		<p>This bit, along with <b>Number of Multisamples</b>, determines how PS threads are dispatched. Software programs this bit depending on the per-pixel v.s per-sample PS execution requirement. When <b>RT Independent Rasterization Enable = 1</b>, value of 0h for this field is not allowed.</p>			
		<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>
		0h	MSDISPMODE_PERSAMPLE	This is the high-quality DX10.1 multisample mode where (over and above PERPIXEL mode) the PS is run for each covered sample. This mode is also used for "normal" non-multisample rendering (aka 1X), given Number of Multisamples is programmed to NUMSAMPLES_1.	All
		1h	MSDISPMODE_PERPIXEL	This is the classic multisample mode of operation, typically used for both antialiasing and transparency. Setup and rasterization operate in full multisample mode, testing coverage and depth/stencil test at the sample level but only running the PS once per pixel.	All
		30	<b>PS UAV-only</b>		
			Project:	HSW	
			Format:	U1	
This field is set when PS accesses UAV and does not output to render target.					
<b>Value</b>	<b>Name</b>		<b>Description</b>	<b>Project</b>	
0h	OFF		PS outputs RT	All	
1h	ON		PS does not output RT and has a UAV access.	All	
<b>Note:</b>			<b>Project</b>		
<b>Note:</b> This feature is NOT SUPPORTED and therefore this bit must not be set.			DevHSW:GT3:A0		
29:0	<b>Reserved</b>				
	Project:	HSW			
	Format:	MBZ			

## 3DSTATE\_CONSTANT\_VS

3DSTATE_CONSTANT_VS		
Project:	HSW	
Source:	RenderCS	
Length Bias:	2	
This command sets pointers to the push constants for VS unit. The constant data pointed to by this command is loaded into the VS unit's push constant buffer (PCB).		
Programming Notes		Project
[DevHSW+] A 3DSTATE_GATHER_VS command must be dispatched along with any 3DSTATE_CONSTANT_VS command when Gather Pool is enabled within a batch buffer.		DevHSW+
Note:		Project
<p><b>Note:</b> A dummy 3DPRIMITIVE (zero vertices) command must be executed prior to any 3DSTATE_CONSTANT_* command in a command buffer. This programming must not be done when Resource Streamer is enabled with Gather Pool Enabled, as the same issue exists for programming 3DSTATE_GATHER_CONSTANT_* command which also suffices for 3DSTATE_CONSTANT_* command.</p> <p>3DPRIMITIVE – To ensure resource streamer initiates produce prior to next command            Indirect Parameter Enable = 0            UAV Coherency Required = 0            Predicate Enable = 0            End Offset Enable = 0            Vertex Access Type = SEQUENTIAL            Primitive Topology Type = 3DPRIM_POINTLIST            Vertex Count Per Instance = 0            Start Vertex Location = 0            Instance Count = 0            Start Instance Location = 0            Base Vertex Location = 0</p> <p>Example:            3DPRIMITIVE //Dummy 3DPRIMITIVE programmed for above WA with '0' vertices            3DSTATE_CONSTANT_VS            .            . //Other state commands and no 3DPRIMITIVE command.</p> <p>3DPRIMITIVE //Dummy 3DPRIMITIVE programmed for above WA with '0' vertices            3DSTATE_CONSTANT_PS            3DPRIMITIVE //Legitimate 3DPRIMITIVE command</p>		HSW

		Project:	All
		Format:	MBZ
	13	<b>Illegal Opcode Exception Enable</b>	
		Project:	All
		Format:	Enable
		This bit gets loaded into EU CR0.1[12] (note the bit # difference). See Exceptions and ISA Execution Environment.	
	12	<b>Software Exception Enable</b>	
		Project:	DevHSW+
		Format:	Enable
		This bit gets loaded into EU CRO1[13] (note the bit # difference). See Exceptions and ISA Execution Environment.	
	11:8	<b>Reserved</b>	
		Project:	All
		Format:	MBZ
	7:0	<b>Maximum Number of Threads</b>	
		Project:	HSW
		Format:	U8 Thread Count - 1
		Specifies the maximum number of simultaneous threads allowed to be active. Used to avoid using up the scratch space. Programming the value of the max threads over the number of threads based off number of threads supported in the execution units may improve performance since the architecture allows threads to be buffered between the check for max threads and the actual dispatch into the EU. Programming the max values to a number less than the number of threads supported in the execution units may reduce performance. Limit is based on max number of HS URB handles.	
		<b>Value</b>	<b>Name</b>
		<b>Description</b>	<b>Project</b>
		[0,255]	
		indicating a thread count of [1,256]	HSW
		[0,69]	
		indicating a thread count of [1,70]	DevHSW:GT1
2	31	<b>Enable</b>	
		Project:	All

## 3DSTATE\_HS

		Format:	Enable
		<p>Specifies whether the HS function is enabled or disabled (pass-through). If ENABLED MI_TOPOLOGY_FILTER must be used to silently discard any topologies that the HS kernel is not expecting. E.g., if the HS kernel is expecting PATCHLIST_32 topologies, MI_TOPOLOGY_FILTER must be set to PATCHLIST_32 so only those topologies can reach the enabled HS.</p>	
		<b>Programming Notes</b>	
		<p>The tessellation stages (HS, TE and DS) must be enabled/disabled as a group. I.e., draw commands can only be issued if all three stages are enabled or all three stages are disabled, otherwise the behavior is UNDEFINED.</p>	
30	<b>Reserved</b>		
		Project:	HSW
		Format:	MBZ
29	<b>Statistics Enable</b>		
		Project:	All
		Format:	Enable
		<p>This bit controls whether HS-unit-specific statistics register(s) will increment (for each patch).</p>	
28:18	<b>Reserved</b>		
		Project:	All
		Format:	MBZ

		Project:	HSW
		Format:	MBZ
7:4	<b>Reserved</b>		
		Project:	All
		Format:	MBZ
3:0	<b>Instance Count</b>		
		Project:	All
		Format:	U4-1
		<p>This field determines the number of threads (minus one) spawned per input patch. If the HS kernel uses a barrier function, software must restrict the <b>Instance Count</b> to the number of threads that can be simultaneously active within a half-slice. Factors which must be considered includes scratch memory availability.</p>	
		<b>Value</b>	<b>Name</b>
		[0,15]	<b>Description</b>
			representing [1,16] instances
		<b>Programming Notes</b>	
		<b>Project</b>	

<b>3DSTATE_HS</b>				
		The Instance count must always be set to 0 unless the Include Vertex Handles is enabled.	HSW	
3 <b>Project:</b> DevHSW	31:6	<b>Kernel Start Pointer</b>		
		Project:	All	
	Format:	InstructionBaseOffset[31:6]Kernel		
	This field specifies the starting location (1st GEN core instruction) of the kernel program run by threads spawned by this FF unit. It is specified as a 64-byte-granular offset from the Instruction Base Address.			
5:0	<b>Reserved</b>			
	Project:	All		
	Format:	MBZ		
4 <b>Project:</b> DevHSW	31:10	<b>Scratch Space Base Pointer</b>		
		Project:	HSW	
	Format:	GeneralStateOffset[31:10]		
	Specifies the location of the scratch space area allocated to this FF unit, specified as a 1KB-granular offset from the General State Base Address. If required, each thread spawned by this FF unit will be allocated some portion of this space, as specified by Per-Thread Scratch Space.			
	9:4	<b>Reserved</b>		
		Project:	HSW	
	Format:	MBZ		
	3:0	<b>Per-Thread Scratch Space</b>		
		Project:	HSW	
		Format:	U4 power of 2 Bytes over 1K Bytes	
Specifies the amount of scratch space to be allocated to each thread spawned by this FF unit. The driver must allocate enough contiguous scratch space, starting at the Scratch Space Base Pointer, to ensure that the Maximum Number of Threads can each get Per-Thread Scratch Space size without exceeding the driver-allocated scratch space.				
		<b>Value</b>	<b>Name</b>	
	[0,11]	indicating [1K Bytes, 2M Bytes]		
5 <b>Project:</b> DevHSW	31:28	<b>Reserved</b>		
		Project:	HSW	
	Format:	MBZ		
	27	<b>Single Program Flow</b>		
Project:		HSW		
Specifies the initial condition of the kernel program as either a single program flow (SIMDn <sub>xm</sub> with m = 1) or as multiple program flows (SIMDn <sub>xm</sub> with m > 1). See CR0 description in ISA				

## 3DSTATE\_HS

	28	<b>Attribute Swizzle Control Mode</b>
		Project: HSW
Format: U1 enumerated type		
When Attribute Swizzle Enable is ENABLED, this bit controls whether attributes 0-15 or 16-31 are subject to the following swizzle controls:		

## 3DSTATE\_SBE

- Attribute n Component Override X/Y/Z/W
- Attribute n Constant Source
- Attribute n Swizzle Select
- Attribute n Source Attribute
- Attribute n Wrap Shortest Enables

Note that the Number of SF Output Attributes field specifies how many attributes are output.  
 Note: This field does not impact any functions which provide separate states for all 32 attributes (e.g., Point sprite, Constant interpolation).

**27:22 Number of SF Output Attributes**

Project:	HSW
Format:	U6 count of attributes

Specifies the number of vertex attributes passed from the SF stage to the WM stage (does not include Position).

Value	Name
[0,32]	

**21 Attribute Swizzle Enable**

Project:	All
Format:	Enable

Enables the SF to perform swizzling on (up to the first 16) vertex attributes. If DISABLED, all vertex attributes are passed through.

**20 Point Sprite Texture Coordinate Origin**

Project:	All
Format:	U1 enumerated type

This state controls how Point Sprite Texture Coordinates are generated (when enabled on a per-attribute basis by Point Sprite Texture Coordinate Enable).

Value	Name	Description	Project
0h	UPPERLEFT	Top Left = (0,0,0,1)Bottom Left = (0,1,0,1)Bottom Right = (1,1,0,1)	All
1h	LOWERLEFT	Top Left = (0,1,0,1)Bottom Left = (0,0,0,1)Bottom Right = (1,0,0,1)	All

**19:16 Reserved**

Project:	All
Format:	MBZ

**15:11 Vertex URB Entry Read Length**

Project:	All
Format:	U5 Specifies the amount of URB data read for each Vertex URB entry, in 256-bit register increments.

## 3DSTATE\_SBE

		Value	Name
		[1,16]	
		<b>Programming Notes</b>	
		<p>It is UNDEFINED to set this field to 0 indicating no Vertex URB data to be read. This field should be set to the minimum length required to read the maximum source attribute. The maximum source attribute is indicated by the maximum value of the enabled Attribute # Source Attribute if Attribute Swizzle Enable is set, Number of Output Attributes-1 if enable is not set.</p> <p><math>read\_length = \text{ceiling}((\text{max\_source\_attr}+1)/2)</math></p>	
	10	<b>Reserved</b>	
		Project:	All

		Format:	U5	
		This field selects the source attribute for Attribute 0. Source attribute 0 corresponds to the first 128 bits of data indicated by Vertex URB Entry Read Offset		
10	31:0	<b>Point Sprite Texture Coordinate Enable</b>		

## 3DSTATE\_SBE

		Project:	All
		Format:	32-bit bitmask
		<b>Description</b>	
		When processing point primitives, the attributes from the incoming point vertex are typically copied to the point object corner vertices. However, if a bit is set in this field, the corresponding Attribute is selected as a Point Sprite Texture Coordinate, in which case each corner vertex is assigned a pre-defined texture coordinate as defined by the Point Sprite Texture Coordinate Origin state bit. Bit 0 corresponds to output Attribute 0.	
		[DevHSW]: This field is ignored when non-point primitives are rendered.	
		<b>Project</b>	
		HSW	
11	31:0	<b>Constant Interpolation Enable[31:0]</b>	
		Project:	All
		This field is a bitmask containing a Constant Interpolation Enable bit for each corresponding attribute. If a bit is set, that attribute will undergo constant interpolation, and the corresponding WrapShortest Enable bits (if defined) will be ignored. If a bit is clear, components which are not enabled for WrapShortest interpolation (if defined) will be linearly interpolated.	
12	31:28	<b>Attribute 7 WrapShortest Enables</b>	
		Project:	All
		Format:	Enable[4]
		This state selects which components (if any) of Attribute 7 are to be interpolated in a "wrap shortest" fashion. Operation is UNDEFINED if any of these bits are set and the Constant Interpolation Enable bit associated with this attribute is set. Note that wrap-shortest interpolation is only supported for Attributes 0-15. Bit 0: WrapShortest X Component Bit 1: WrapShortest Y Component Bit 2: WrapShortest Z Component Bit 3: WrapShortest W Component	
	27:24	<b>Attribute 6 WrapShortest Enables</b>

	25:18	<b>Binding Table Entry Count</b>																																	

## 3DSTATE\_PS

		Project:	All
		Format:	U8
		<b>Description</b>	<b>Project</b>
		Specifies how many binding table entries the kernel uses. Used only for prefetching of the binding table entries and associated surface state. Note: For kernels using a large number of binding table entries, it may be advantageous to set this field to zero to avoid prefetching too many entries and thrashing the state cache. This field is ignored if [PS Function Enable] is DISABLED.	
		When <b>HW Generated Binding Table</b> bit is enabled: <b>This field indicates which cache lines (512bit units - 32 Binding Table Entry section) should be fetched. Each bit in this field corresponds to a cache line. Only the 1st 4 non-zero Binding Table entries of each 32 Binding Table entry section prefetched will have its surface state prefetched.</b> See 3D Pipeline for more information.	
		<b>Value</b>	<b>Name</b>
		[0,255]	
		<b>Programming Notes</b>	
		When HW binding table bit is set, it is assumed that the Binding Table Entry Count field will be generated at JIT time.	
17	<b>Thread Priority</b>	Project:	HSW

## 3DSTATE\_PS

		Format:	Enable
		This field is set to enable clear value resolve on non-multisampled render targets. See "Render Target Resolve" for restrictions on enabling this field.	
5	<b>PS Accesses UAV</b>	Project:	HSW
		Format:	Enable
		This field must be set when PS has a UAV access.	
4:3	<b>Position XY Offset Select</b>	Project:	All
		Format:	U2 Enumerated Type
		This field specifies if/what Position XY Offset values are passed in the PS payload. Note that these are per-slot (pixel sample) offsets, and therefore separate from the subspan XY coordinates passed in R1.	
		<b>Value</b>	<b>Name</b>
		<b>Description</b>	<b>Project</b>
		0h	POSOFFSET_NONE
		1h	Reserved
		2h	POSOFFSET_CENTROID
		3h	POSOFFSET_SAMPLE
		No Position XY Offsets are included in the PS payload.	All
		Position XY Offsets will be passed in the PS payload, and these will reflect the Centroid position(s).	All
		Position XY Offsets will be passed in the PS payload, and these will reflect the multisample position(s).	All
		<b>Programming Notes</b>	
		SW Recommendation: If the PS kernel needs the Position Offsets to compute a Position XY value, this field should match Position ZW Interpolation Mode to ensure a consistent position.xyzw computation	
		If the PS kernel does not need the Position XY Offsets to compute a Position Value, then this field should be programmed to POSOFFSET_NONE, as the PS kernel should be using the various barycentric inputs to evaluate other-than-position attributes. However, this field can be used to pass Centroid or Sample offsets in the payload for special test modes (e.g., where barycentric coordinates are computed in the PS vs. being HW-generated and passed in the payload).	
		MSDISPMODE_PERSAMPLE is required in order to select POSOFFSET_SAMPLE.	
2	<b>32 Pixel Dispatch Enable</b>	Project:	All
		Format:	Enable
		<b>Description</b>

	Format:	MBZ
--	---------	-----

## 3DSTATE\_URB\_VS

<b>3DSTATE_URB_VS</b>			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
Description			
VS URB Entry Allocation Size equal to 4(5 512-bit URB rows) may cause performance to decrease due to banking in the URB. Element sizes of 16 to 20 should be programmed with six 512-bit URB rows.			
This command may not overlap with the push constants in the URB defined by the 3DSTATE_PUSH_CONSTANT_ALLOC_VS, 3DSTATE_PUSH_CONSTANT_ALLOC_DS, 3DSTATE_PUSH_CONSTANT_ALLOC_HS, and 3DSTATE_PUSH_CONSTANT_ALLOC_GS commands.			
Project			
HSW			
Programming Notes			
3DSTATE_URB_HS, 3DSTATE_URB_DS, and 3DSTATE_URB_GS must also be programmed in order for the programming of this state to be valid.			
DWord	Bit	Description	
0	31:29	<b>Command Type</b>	
		Default Value:	3h GFXPIPE
		Format:	OpCode
	28:27	<b>Command SubType</b>

### 3DSTATE\_URB\_VS

1	31	<b>Reserved</b>	
		Project:	HSW
		Format:	MBZ
	30:25	<b>VS URB Starting Address</b>	
		Project:	HSW
		Offset from the start of the URB memory where VS starts its allocation, specified in multiples of 8 KB.	
		<b>Value</b>	<b>Name</b>
		[0,63]	
	24:16	<b>VS URB Entry Allocation Size</b>	
		Project:	All
		Format:	U9-1 count of 512-bit units
		Specifies the length of each URB entry owned by VS. This field is always used (even if VS Function Enable is DISABLED).	
		<b>Programming Notes</b>	
		Programming Restriction: As the VS URB entry serves as both the per-vertex input and output of the VS shader, the VS URB Allocation Size must be sized to the maximum of the vertex input and output structures.	
	15:0	<b>VS Number of URB Entries</b>	
		Project:	All
		Format:	U16
		Specifies the number of URB entries that are used by VS. This field is always used (even if VS Function Enable is DISABLED).	
		<b>Value</b>	<b>Name</b>
		[64,1664]	DevHSW:GT3
		[64,1664]	DevHSW:GT2
		[32,640]	DevHSW:GT1
		<b>Programming Notes</b>	
		Programming Restriction: VS Number of URB Entries must be divisible by 8 if the VS URB Entry Allocation Size is less than 9 512-bit URB entries."2:0" = reserved "000b"	
		The VS Number of URB Entries must be less than 1280 and the VS cache needs to be disabled.

		Format:	MBZ
	22:6	<b>Gather Buffer Offset</b>	
		Format:	GatherBufferOffset[22:6]
		This field specifies the offset of the gather buffer within the Gather Pool.	
		<b>Programming Notes</b>	
		SW increments the offset by the size of the gather buffer in 512 bit units for each gather buffer generated.	
	5	<b>Reserved</b>	
		Project:	HSW
		Format:	MBZ
	4	<b>PS Constant Buffer Dx9 Enable</b>	
		Format:	Enable
		When this bit is set it indicates that the PS constant buffer is a HW generated Dx9 constant buffer. The resource streamer will wait for the Dx9 constant buffer generator to be done before issuing this command to ensure buffer synchronization. Additionally the Dx9 constant buffers are a single buffer but larger than 4KB. Internally the HW will treat the DX9 buffer as 2 constant buffers. When this bit is enable only the 1st constant buffer valid bit is set. The 2nd constant buffer surface pointer will automatically be the 1st pointer + 4KB.

	Format:	ConstantBufferIndexOffset[3:0]		
This field specifies the Binding Table index offset from the <b>Constant Buffer Binding Table Block</b> starting point in the Binding Table. This value is added to the <b>Constant Buffer Binding Table Block</b> will result in the Binding Table Index pointing to the surface state containing the constant buffer to be referenced.				
If <b>PS Constant Buffer Dx9 Enable</b> is set then a value of '1' specifies that the fetch to the constant buffer should be offset by 4KB in order to address the upper 4K of the constant buffer. Any value greater than '1' is invalid when <b>PS Constant Buffer Dx9 Enable</b> is set.				
15:8	<b>Constant Buffer Offset for Entry 2n+0</b>			
	Project:	All		
		Format:	ConstantBufferOffset[7:0]	
		Format:	Offset[7:0]ConstantBuffer	
This field specifies the Offset in 128-bit units of the 128b entry fetched from the constant buffer for entry 2n+0 (including when <b>On-Die Table Read Enable</b> is set).				
7:4	<b>Channel Mask for Entry 2n+0</b>			
	Project:	All		

## 3DSTATE\_GATHER\_CONSTANT\_PS

		Format:	Mask[3:0]
		Each bit of this field correspond to the 4 channels of each entry fetched from memory. When the bit is a 1, the corresponding 32-bit value is loaded in FF's push constant buffer. When the bit is a 0, the corresponding 32-bit value is not loaded. If this field is zero it means the entry is not used.	
3:0	<b>Binding Table Index offset for Entry 2n+0</b>		
	Project:	All	
	Format:	Constant Buffer Index offset [3:0]Surface State for ConstantBuffer	
	This field specifies the Binding Table index offset from the <b>Constant Buffer Binding Table Block</b> starting point in the Binding Table. This value is added to the <b>Constant Buffer Binding Table Block</b> will result in the Binding Table Index pointing to the surface state containing the constant buffer to be referenced. If <b>PS Constant Buffer Dx9 Enable</b> is set then a value of '1' specifies that the fetch to the constant buffer should be offset by 4KB in order to address the upper 4K of the constant buffer. Any value greater than '1' is invalid when <b>PS Constant Buffer Dx9 Enable</b> is set.		

## 3DSTATE\_DX9\_CONSTANTF\_VS

3DSTATE_DX9_CONSTANTF_VS			
Project:	HSW		
Source:	RenderCS

## 3DSTATE\_DX9\_GENERATE\_ACTIVE\_PS

3DSTATE_DX9_GENERATE_ACTIVE_PS			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
The 3DSTATE_DX9_GENERATE_ACTIVE_PS command is used to generate fixed functions' DX9 Constant Buffer. A DX9 Constant register is made active by writing it out to the constant buffer.			
<b>Programming Notes</b>			
Restriction: The global and local buffers are not initialized after reset. Any data written without being initialized will be undefined. DX9 constant buffers are written due to context save/restore or the Generate Active Command.

		Project: All
		Format: S15 in Pixels from Color Buffer origin (upper left corner).
		Specifies Y origin of Drawing Rectangle (in whole pixels) relative to origin of the Color Buffer, used to map incoming (Draw Rectangle-relative) vertex positions to the Color Buffer space.
15:0	<b>Drawing Rectangle Origin X</b>	
		Project: All
		Format: S15 in Pixels from Color Buffer origin (upper left corner).
		Specifies X origin of Drawing Rectangle (in whole pixels) relative to origin of the Color Buffer, used to map incoming (Draw Rectangle-relative) vertex positions to the Color Buffer space.

## 3DSTATE\_SAMPLER\_PALETTE\_LOAD0

3DSTATE_SAMPLER_PALETTE_LOAD0			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
Description		Project	
The 3DSTATE_SAMPLER_PALETTE_LOAD0 instruction is used to load 32-bit values into the first texture palette. The texture palette is used whenever a texture with a paletted format (containing "Px [palette0]") is referenced by the sampler.		HSW	
This instruction is used to load all or a subset of the 256 entries of the first palette. Partial loads always start from the first (index 0) entry.		HSW

		Project:	All		
		Format:	MBZ		
2	31:0	<b>ChromaKey Low Value</b> This field specifies the "low" (minimum) value of the chroma key range. Texel samples are considered "matching the key" if each component of the texel falls within the (inclusive) chroma range. See ChromaKey High Value for further format, programming info.			
3	31:0	<b>ChromaKey High Value</b> This field specifies the "high" (maximum) value of the chroma key range. Texel samples are considered "matching the key" if each component of the texel falls within the (inclusive) chroma range.			
		<b>Programming Notes</b>			
		ChromaKey values are specified using 8-bit channels. When using surface formats with less than 8 bits per channel, the device will expand channels by replicating the required number of MSBs into the LSBs of each channel. Software must account for this conversion when it programs Chromakey Low/High Values (e.g., by performing the same replication).			
		For channels that do not exist in the actual surface (e.g., Alpha channel for non-ARGB maps), software must explicitly program full range high/low values (High=FFh, Low=0h for formats using unsigned chroma key values, High=7Fh, Low=FFh for formats using sign magnitude chroma key values) in order to effectively remove the comparison of that field from the ChromaKey function.			
		For channels in SNORM format in the surface format, the value in the high/low value for that channel is interpreted in sign magnitude format. Negative zero value is not supported (use positive zero instead). For channels with mixed UNORM/SNORM formats (i.e. R5G5_SNORM_B6_UNORM), the ChromaKey is programmed as if all channels are SNORM.			
		YUV ChromaKey will use an interpolated chrominance value from the map for comparison to the chroma key values for those texels without chrominance due to downsampling. The chrominance value used is the average of values to the left and right of the texel in question.			
		It is UNDEFINED to program any component of the ChromaKey High Value to be less than the corresponding component of ChromaKey Low Value.			
		Format = interpreted according to associated texel format "class":			
		Only the surface formats listed as supported for chroma key in the surface formats table can be used with this feature. Use of any other surface format with chroma key enabled is UNDEFINED.

		Alpha channel loaded into the Nth entry of the texture color palette.	

## 3DSTATE\_MULTISAMPLE

3DSTATE_MULTISAMPLE			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
<p>The 3DSTATE_MULTISAMPLE command is used to specify multisample state associated with the current render target/depth buffer. This is non-pipelined state.</p> <p>Programming Restriction:</p> <p>Driver must hierarchi that all the caches in the depth pipe are flushed before this command is parsed. This requires driver to send a PIPE_CONTROL with a CS stall along with a Depth Flush prior to this command.</p> <p>When this command is issued, the currently active depth buffer, hierarchical depth buffer, stencil buffer, and render target(s) must be cleared (meaning that every pixel must be overwritten). Alternatively, other surfaces can be activated before issuing the next 3DPRIMITIVE that were previously rendered with the same values of all state fields in this command. In other words, it is illegal to render to these surfaces with multiple different values of the state fields in this command.</p>			
<b>Programming Notes</b>			
<p>When programming the sample offsets (for NUMSAMPLES_4 or _8 and MSRASTMODE_xxx_PATTERN), the order of the samples 0 to 3 (or 7 for 8X) must have monotonically increasing distance from the pixel center. This is required to get the correct centroid computation in the device.</p>			
DWord	Bit	Description	
0	31:29	<b>Command Type</b>	
		Default Value:	3h GFXPIPE
		Format:	OpCode
	28:27	<b>Command SubType</b>

1	31:6	<b>Reserved</b>			
		Project:	All		
		Format:	MBZ		
	5	<b>Multi Sample Enable</b>			
		Project:	DevHSW+		
		Format:	Enable		
		This field specifies if the multi sample enable state API is set or not.			
		<b>Programming Notes</b>			
		Setting this field along with setting the Pixel Location to upper left and number of multisamples to greater than one will cause the device to offset pixel positions by 0.5 both in horizontal and vertical directions.			
		It is to be noted this is done to adjust the pixel co-ordinate system to DX9 like, so any screen space rectangles (eg: HiZ Clear, Resolve etc) generated internally by driver in this mode needs to be aware of this offset adjustment and send the rectangles according to alignment restriction taking this offset adjustment into consideration.			
		SW can choose to set this bit only for DX9 API. DX10/OGL API's should not have any effect by setting or not setting this bit.			
		<b>Note:</b>	<b>Project</b>		
		<b>Note:</b> Due to a hardware issue, this bit can't be context stored/restored for A0 stepping. Hence software has to rely on the alternative procedure suggested in the Multisample Modes/State section.		DevHSW:GT3:A0	
	4	<b>Pixel Location</b>			
		Project:	All		
		Format:	U1		
		This field specifies where the device evaluates "pixel" (vs. centroid or sample) values/attributes.

## 3DSTATE\_RAST\_MULTISAMPLE

3DSTATE_RAST_MULTISAMPLE			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
<p>The 3DSTATE_RAST_MULTISAMPLE command is used to specify number of samples and offsets used for raster function and it is independent of render target/depth buffer. This is non-pipelined state.</p> <p>Programming Restriction: Driver must guarantee that all the caches in the depth pipe are flushed before this command is parsed. This requires driver to send a PIPE_CONTROL with a CS stall along with a Depth Flush prior to this command.</p> <p><b>This packet must be sent even if there is no Multisample Rasterization independent of render target multisampling. This command is ignored if Render Target Independent Rasterization is disabled.</b></p>			
Programming Notes			
3DSTATE_RAST_MULTISAMPLE is for [DevHSW] only.			
Project

## 3DSTATE\_RAST\_MULTISAMPLE

<b>3DSTATE_RAST_MULTISAMPLE</b>				
1	31:4	<b>Reserved</b>		
		Project: All		
		Format: MBZ		
	3:1	<b>Number of Rasterization Multisamples</b>		
		Project: All		
		Format: U3		
		This field specifies how many samples/pixel exist for rasterization only, as $\log_2(\#samples)$ .		
		<b>Value</b>	<b>Name</b>	<b>Description</b>
		0h	NUMRASTSAMPLES_1	1 rast-sample/pixel, No multisampling for rasterization.
		1h	NUMRASTSAMPLES_2	2 rast-samples/pixel
2h		NUMRASTSAMPLES_4	4 rast-samples/pixel	
3h		NUMRASTSAMPLES_8	8 rast-samples/pixel	
4h		NUMRASTSAMPLES_16	16 rast-samples/pixel	
5h-7h	Reserved			
<b>Programming Notes</b>				
When, Number of Multisamples (output) = NUMSAMPLES_1 and <b>RT Independent Rasterization Enable = 1</b> , this field can have values of 1h, 2h, 3h or 4h.				
When, Number of Multisamples (output) = NUMSAMPLES_1 and <b>RT Independent Rasterization Enable != 1</b> , this field must be 0h.				
When, Number of Multisamples (output) != NUMSAMPLES_1 and RT Independent Rasterization Enable = 1, Number of Rasterization Multisamples field must be 0h.				
Depending on the NUMRASTSAMPLES_*, (x,y) offsets must be programmed accordingly. The rest of the offsets are ignored by hardware.

## 3DSTATE\_PUSH\_CONSTANT\_ALLOC\_GS

### 3DSTATE\_PUSH\_CONSTANT\_ALLOC\_GS

Project: HSW  
 Source: RenderCS  
 Length Bias: 2

This command sets up the URB configuration for GS Push Constant Buffer.

#### Programming Notes

- The sum of the Constant Buffer Offset and the Constant Buffer Size may not exceed the maximum value of the Constant Buffer Size.
- The sum of the constant length programmed in 3DSTATE\_CONSTANT\_GS must be equal or smaller than the size of the allocated space in the URB including the buffering for half cachelines.
- The 3DSTATE\_CONSTANT\_GS must be reprogrammed prior to the next 3DPRIMITIVE command after programming the 3DSTATE\_PUSH\_CONSTANT\_ALLOC\_GS.

See Push Constant URB Allocation section for more details.

Format:	U8 #entries													

### 3DSTATE\_SO\_DECL\_LIST

		<p>Specifies the number of valid SO_DECL entries for Stream 0. Note that the SO_DECLs are programmed in groups of four (one SO_DECL for each of the four streams). Therefore the number of 2-DWord groups of SO_DECLs supplied in this command is derived from the stream(s) with the most valid SO_DECLs. The NumEntries value specific to each stream will indicate how many SO_DECLs are valid for that particular stream. Any trailing invalid SO_DECLs supplied for streams with fewer valid SO_DECLs will be ignored. It is legal to specify Num Entries = 0 for all four streams simultaneously. In this case there will be no SO_DECLs included in the command (only DW 0-2). Note that all Stream to Buffer Selects bits must be zero in this case (as no streams produce output).</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; text-align: center;">Value</th> <th style="width: 50%; text-align: center;">Name</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">[0,128]</td> <td style="text-align: center;">entries</td> </tr> </tbody> </table>	Value	Name	[0,128]	entries

## 3DSTATE\_BINDING\_TABLE\_POOL\_ALLOC

3DSTATE_BINDING_TABLE_POOL_ALLOC			
Project:	HSW		
Source:	RenderCS		
Length Bias:	2		
This command sets up the binding table pool for HW generated binding tables.			
DWord	Bit	Description	
0	31:29	<b>Command Type</b>	
		Default Value:	3h GFXPIPE
		Format:	OpCode
	28:27	<b>Command SubType</b>	
		Default Value:	3h GFXPIPE_3D
		Format:	OpCode
	26:24	<b>3D Command Opcode</b>	
		Default Value:	1h 3DSTATE_NONPIPELINED
		Format:	OpCode
	23:16	<b>3D Command Sub Opcode</b>	
Default Value:		19h 3DSTATE_BINDING_TABLE_POOL_ALLOC	
Format:		OpCode	
15:8	<b>Reserved</b>		
	Project:	All	
	Format:	MBZ	
7:0	<b>DWord Length</b>	Project:	All
		Format:	=n
	<b>Value</b>	<b>Name</b>	<b>Project</b>
	1h	DWORD_COUNT_n [Default]	HSW
1	31:12	<b>Binding Table Pool Base Address</b>	
		Project:	All
		Format:	GraphicsAddress[31:12]Binding_Table_Pool
Specifies the base address of the Binding Table pool.			
	11	<b>Binding Table Pool Enable</b>	

## 3DSTATE\_BINDING\_TABLE\_POOL\_ALLOC

		Project:	All			
		Format:	U1			
		When this bit is set it enables the hardware will use the binding table pool address for fetching binding entries. This bit must be set if the resource streamer is enable.				
		<b>Programming Notes</b>			<b>Project</b>	
		This bit must not be set when resource streamer is disabled and executing a 3DSTATE_BINDING_TABLE_POINTER.			HSW	
		<b>10:7 Surface Object Control State</b>				
		Project:	HSW			
		Format:	<b>MEMORY_OBJECT_CONTROL_STATE</b>			
		Specifies the memory object control state for this surface.				
		<b>Programming Notes</b>				
Bit 10 (the high bit of this 4-bit field) is not programmable and is always zero.						
<b>6:5 Reserved</b>						
Default Value:		11b				
Project:		HSW				
Format:		Must Be One				
<b>4:0 Reserved</b>						
Project:		HSW				
Format:		MBZ				
2 <b>Project:</b> DevHSW	31:12	<b>Binding Table Pool Upper Bound</b>				
		Project:	HSW			
		Format:	GraphicsAddress[31:12]			
		This field specifies the 4K-byte aligned (exclusive) maximum Graphics Memory address access by an 3DSTATE_BINDING_TABLE_POINTER command when HW generate Binding tables are enabled. Indirect data accessed at this address and beyond will appear to be 0. Setting this field to 0 will cause this range check to be ignored.				
		<b>Programming Notes</b>				
		If non-zero, this address must be greater than the <b>Binding Table Pool Base Address</b> .				
		<b>Restriction</b>				
		Restriction : The pool must be disabled if the value of this field is zero.				
		<b>11:0 Reserved</b>				
		Project:		HSW

Project:	All																						
Format:	U1																						

## PIPE\_CONTROL

		irrespective of this bit setting	
		If ENABLED, PIPE_CONTROL command will flush the in flight data written out by render engine to Global Observation point on flush done. Also Requires stall bit ([20] of DW1) set.	
		<b>Programming Notes</b>	<b>Project</b>
		If ENABLED, all TLBs belonging to Render Engine will be invalidated once the flush operation is complete. Note that if the flush TLB invalidation mode is clear, a TLB invalidate will occur irrespective of this bit setting.	HSW
17	<b>Reserved</b>		
	Project:	HSW	
	Format:	MBZ	
16	<b>Generic Media State Clear</b>		
	Project:	HSW	
	Format:	Disable	
	<p>If set, all generic media state context information will not be included with the next context save, assuming no new state is initiated after the flush. If clear, the generic media state context save state will not be affected. An MI_FLUSH with this bit set should be issued once all the Media Objects that will be processed by a given persistent root thread have been issued or when an MI_SET_CONTEXT switching from a generic media context to a 3D context completes. When using MI_SET_CONTEXT, once state is programmed, it will be saved and restarted as part of any context each time that context is saved/restored until an MI_FLUSH with this bit set is issued in that context.</p>		
15:14	<b>Post Sync Operation</b>		
	Project:	All	
		<b>Description</b>	<b>Project</b>
	This field specifies an optional action to be taken upon completion of the synchronization operation.		
	This field must be cleared if the LRI Post-Sync Operation bit is set.		HSW
	<b>Value</b>	<b>Name</b>	<b>Description</b>
	0h	No Write	No write occurs as a result of this instruction. This can be used to implement a "trap" operation, etc.
	1h	Write Immediate Data	Write the QWord containing Immediate Data Low, High DWs to the Destination Address
	2h	Write PS Depth Count	Write the 64-bit PS_DEPTH_COUNT register to the Destination Address
	3h	Write Timestamp	Write the 64-bit TIMESTAMP register to the Destination Address
			<b>Project</b>
			All

## PIPE\_CONTROL

PIPE_CONTROL			
<b>Programming Notes</b>			
If executed in non-secure batch buffer, the address given will be in a PPGTT address space. If in a secure ring or batch, address given will be in GGTT space			
13	<b>Depth Stall Enable</b>		
Project:		All	
Format:		Enable	
This bit should be set when obtaining a "visible pixel" count to preclude the possible inclusion in the PS_DEPTH_COUNT value written to memory of some fraction of pixels from objects initiated after the PIPE_CONTROL command.			
<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>
0h	Disable	3D pipeline will not stall subsequent primitives at the Depth Test stage.	All
1h	Enable	3D pipeline will stall any subsequent primitives at the Depth Test stage until the Sync and Post-Sync operations complete.	All
<b>Programming Notes</b>			
This bit should be DISABLED for operations other than writing PS_DEPTH_COUNT.			
This bit will have no effect (besides preventing write cache flush) if set in a PIPE_CONTROL command issued to the Media pipe.			
12	<b>Render Target Cache Flush Enable</b>		
Project:		All	
Format:		Enable	
Setting this bit will force Render Cache to be flushed to memory prior to this synchronization point completing. This bit should be set for all write fence sync operations to assure that results from operations initiated prior to this command are visible in memory once software observes this synchronization.			
<b>Value</b>	<b>Name</b>	<b>Description</b>	<b>Project</b>
0h	Disable Flush	Render Target Cache is NOT flushed.	All
1h	Enable Flush	Render Target Cache is flushed.	All
<b>Programming Notes</b>			
This bit should be DISABLED for End-of-pipe (Read) fences, PS_DEPTH_COUNT or TIMESTAMP queries.			
This bit must not be set when Depth Stall Enable bit is set in this packet.			
11	<b>Instruction Cache Invalidate Enable</b>		
Project:		All	
Format:		Enable	
Setting this bit is independent of any other bit in this packet. This bit controls the invalidation			

<b>PIPE_CONTROL</b>		
		of the L1 and L2 at the top of the pipe i.e. at the parsing time.
10	<b>Texture Cache Invalidation Enable</b>	
	Project:	All
	Format:	Enable
	Setting this bit is independent of any other bit in this packet. This bit controls the invalidation of the texture caches at the top of the pipe i.e. at the parsing time.	
9	<b>Indirect State Pointers Disable</b>	
	Project:	All
	Format:	Enable
	<b>Description</b>	<b>Project</b>
	At the completion of the post-sync operation associated with this pipe control packet, the indirect state pointers in the hardware are considered invalid; the indirect pointers are not saved in the context. If any new indirect state commands are executed in the command stream while the pipe control is pending, the new indirect state commands are preserved.	
	Using Invalidate State Pointer (ISP) only inhibits context restoring of Push Constant (3DSTATE_CONSTANT_*) commands. Push Constant commands are only considered as Indirect State Pointers. Once ISP is issued in a context, SW must initialize by programming push constant commands for all the shaders (at least to zero length) before attempting any rendering operation for the same context.	
		HSW
8	<b>Notify Enable</b>	
	Project:	All
	Format:	Enable
	If ENABLED, a Sync Completion Interrupt will be generated (if enabled by the MI Interrupt Control registers) once the sync operation is complete. See Interrupt Control Registers in Memory Interface Registers for details.	
7	<b>Pipe Control Flush Enable</b>	
	Project:	HSW
	Format:	Enable
	If ENABLED, the PIPE_CONTROL command will wait until all previous writes of immediate data from post sync circles are complete before executing the next command.	
6	<b>Reserved</b>	
	Project:	HSW
5	<b>DC Flush Enable</b>	
	Project:	HSW

## PIPE\_CONTROL

		Format:	Enable
		Setting this bit enables flushing of the L3\$ portions that caches DC writes.	
		<b>Programming Notes</b>	
		DC Flush (L3 Flush) by default doesn't result in flushing/invalidating the IA Coherent lines from L3\$, however this can be achieved by setting control bit " <b>Pipe line flush Coherent lines</b> " in "L3SQCREG4" register.	
4	<b>VF Cache Invalidation Enable</b>	Project:	All
		Format:	Enable
		Setting this bit is independent of any other bit in this packet. This bit controls the invalidation of VF address based cache at the top of the pipe i.e. at the parsing time.	
3	<b>Constant Cache Invalidation Enable</b>	Project:	All
		Format:	Enable
		Setting this bit is independent of any other bit in this packet. This bit controls the invalidation of the constant cache at the top of the pipe i.e. at the parsing time.	
2	<b>State Cache Invalidation Enable</b>	Project:	All
		Format:	Enable
		Setting this bit is independent of any other bit in this packet. This bit controls the invalidation of the L1 and L2 state caches at the top of the pipe i.e. at the parsing time.	
1	<b>Stall At Pixel Scoreboard</b>	Project:	All
		Format:	Enable
		Defines the behavior of PIPE_CONTROL command at the pixel scoreboard.	
		<b>Value</b>	<b>Name</b>
		<b>Description</b>	<b>Project</b>
		0h	Disable
		1h	Enable
		Stall at the pixel scoreboard is disabled.	All
		Stall at the pixel scoreboard is enabled.	All
		<b>Programming Notes</b>	
		This bit should be DISABLED for End-of-pipe (Read) fences, PS_DEPTH_COUNT or TIMESTAMP queries. This bit is ignored if Depth Stall Enable is set. Further the render cache is not flushed even if Write Cache Flush Enable bit is set.	
0	<b>Depth Cache Flush Enable</b>	Project:	All
		Format:	Enable

<b>PIPE_CONTROL</b>															
		Setting this bit enables flushing (i.e. writing back the dirty lines to memory and invalidating the tags) of depth related caches. This bit applies to HiZ cache, Stencil cache and depth cache.													
		<table border="1"> <thead> <tr> <th>Value</th> <th>Name</th> <th>Description</th> <th>Project</th> </tr> </thead> <tbody> <tr> <td>0h</td> <td>Flush Disabled</td> <td>Depth relates caches (HiZ, Stencil and Depth) are NOT flushed.</td> <td>All</td> </tr> <tr> <td>1h</td> <td>Flush Enabled</td> <td>Depth relates caches (HiZ, Stencil and Depth) are flushed.</td> <td>All</td> </tr> </tbody> </table>	Value	Name	Description	Project	0h	Flush Disabled	Depth relates caches (HiZ, Stencil and Depth) are NOT flushed.	All	1h	Flush Enabled	Depth relates caches (HiZ, Stencil and Depth) are flushed.	All	
Value	Name	Description	Project												
0h	Flush Disabled	Depth relates caches (HiZ, Stencil and Depth) are NOT flushed.	All												
1h	Flush Enabled	Depth relates caches (HiZ, Stencil and Depth) are flushed.	All												
		<b>Programming Notes</b>													
		Ideally depth caches need to be flushed only when depth is required to be coherent in memory for later use as a texture, source or honoring CPU lock. This bit should be DISABLED for End-of-pipe (Read) fences, PS_DEPTH_COUNT or TIMESTAMP queries.

## PIPE\_CONTROL

		This field should be programmed to 0 when Post-Sync Operation is set to Write PS Depth Count or Write Timestamp.	HSW
--	--	--	-----

## 3DPRIMITIVE

<b>3DPRIMITIVE</b>		
Project:	HSW	
Source:	RenderCS	
Length Bias:	2	
<p>The 3DPRIMITIVE command is used to submit 3D primitives to be processed by the 3D pipeline. Typically the processing results in rendering pixel data into the render targets, but this is not required. The parameters passed in this command are forwarded to the Vertex Fetch function. The Vertex Fetch function will use this information to generate vertex data structures and store them in the URB. These vertices are then passed down the 3D pipeline.</p>		
<b>Programming Notes</b>		
<p>If the threads spawned by this command are required to observe memory writes performed by threads spawned from a previous command, software must precede this command with a command that performs a (preferably pipelined) memory flush (e.g., 3D_PIPECONTROL).</p>		
<p>If the GS is enabled and the input topology is TRILIST_ADJ or TRISTRIP_ADJ with this 3DPRIMITIVE command, a PIPE_CONTROL command with the post sync operation enabled with a store data write immediate must be programmed and dispatched after this 3DPRIMITIVE command. Otherwise the GS state changes after this 3DPRIMITIVE command may get dropped.</p>		
<p>If resource streamer is enabled and <b>RS_PREEMPT_DEBUG(0x20DC bit 0)</b> is not set, an MI_RS_STORE_DATA_IMM with <b>Resource Streamer Flush</b> set must be programmed prior to a 3DPRIMITIVE command.</p>		
<p>SW must explicitly program stalling PIPE_CONTROL flush command with DC Flush Enable and CS Stall bits set prior to 3DPRIMITIVE command with</p> <ul style="list-style-type: none"> <li>• "UAV Coherency Required" AND</li> <li>• UAV Access Enabled for any of the units VS, HS, DS, or GS</li> </ul>		
DWord	Bit	Description
0	31:29	<b>Command Type</b>
